A source of monitor cables for the ST is

Mars Marketing
15W615 Diversey
Elmhurst IL 60126
(312) 530-0988

who has an IBM-style DB-9 to 13-pin DIN cable available for $19.95 +$3
shipping. Another supplier of parts you might try is Best Electronics in
San Jose, CA but I do not have my catalog here at work to tell you if
they have such things available. (incidentally, Mars does take 'magic plastic'
(i.e. VISA/MC)).
Dave

> Why they went with Gem-DOS I have no idea.
>
Either you never owned a C-64 or have a very short memory. The C-64 is no
comparison to the ST. If anything it has a tough time being considered the
equal to the Atari 8bit line.

> Programming on the ST is exactly like programming on the IBM-PC, except that
> there are fewer tools available, and more bugs to work around. After a couple
> of months of struggling the ST went into storage and I financed an Amiga.

I can only guess that you do not have any good software stores avaiable to you
that sell ST software. I find lots of programming utilities available for the
ST. Far more than I can find for my Amiga. My main source for utilities for the
Amiga is thru mail order and not local software houses.

As far as comparing the two machines op sys, I find GEM totally superior to
Workbench. It is much more friendly and easier to work with. As far as CLI
is concerned, I find third party ST stuff far better than either Amiga 1.2 or
1.3. I also get far more Amiga GURU's tha ST bombs. There is no way ever I would
mothball my ST, I am too happy with it and feel very comfortable using it.

OK, the first item of business is that the pc7 and clio archives are separate
and exist on separate machine half way across the nation from each other.
There no longer is an archive at clio.

The second item of business is that him1 (pc7 archive site) probably still
accepts logins. The problem appears to be worse because the machine I reach
at ftp 35.1.1.43 is um.cc.umich.edu. A quick look at a local hosts file
indicates that um.cc.umich.edu is another hosts in the same domain which should
have the address 35.1.1.81. Furthermore, ftp 35.1.1.81 gets me to yet another
host (umix.cc.umich.edu). So, either the umich.edu domain has been scrambled
or part of the connection between here and there has been scrambled.

6. monocrome monitor problems

Newsgroup: comp.sys.atari.st
Date: 1989-01-01 15:52:42 UTC
From: mrd@sun.soe.clarkson.edu
Message-ID: <MRD.89Jan1105242@sun.soe.clarkson.edu>
Source record: 249880

Hello,

Seems my monitor has gone on the fritz. Looks like it lost vertical sync. All I get is a bunch of horizontal lines (I assume the picture) connected by diagonal lines (I assume the retrace).

It started to flake out slowly, only giving problems when I really had some work to do but now it gone. It is one of the Goldstar's. I was hoping to find a crack someplace in the pcboard but no dice. (my cat sort of threw in on the ground one day so it wasn't a bad guess)

Well, without prints I am hopeless. Any ideas as to what may have blown? or maybe what the prints are for this thing so I can figure it out myself? (I used to do this sort of thing, fixing Atari's and TV's back in HS)

thanks

p.s. Where can I get the newest version of Uniterm? I have v2.0c and I assume that this is out of date.

From: 35002_3022@uwovax.uwo.ca
Message-ID: <1166@uwovax.uwo.ca>
Source record: 249881

I eed some help with two things, and hope that some people out here in net land can help me.

First: can anyone tell me where I can get a copy of binhex for the Spectre 128 (read Mac). All of the good software on macserve is binhex'ed format and can not be accessed without a dehexing program - i have gotten one but i have been told that it requires MS Basic...

Second: can anyone tell me how to get at the ftp archives? I may be totally dense, I can not seem to get the silly things working from the addresses I have have found about - including the address that Howard Chu@umich was speaking of.

Much thanks

kevin-john conway

Sorry to disagree... You *are* correct that there no longer is an archive site at clio. The two archives were on separate machines, but they are separated by about two miles, not half a continent. I am system/network administrator of the network clio resides on, and a systems programmer/mail guru for the machine the PC7 archives are stored on.

There is a mixup, yes, but it shouldn't affect FTP users. If you want all the gory details, keep reading. Otherwise, just hit 'n', safe in the knowledge that the PC7 archive is accessible at him1.cc.umich.edu...

Here's the scoop: him1.cc.umich.edu is a network interface for an IBM 3090, running MTS (the Michigan Terminal System). The particular host him1 talks to is um.cc.umich.edu, also known as umichum.bitnet, or by local users, just "UM" (as opposed to "UB," another MTS host in another partition of the 3090). MTS really doesn't support TCP/IP very well, so it relies on front ends like the HIM (Host Interface Machine, a PDP-11/70 with custom software & hardware) to talk on the networks for it. The HIM is a relatively new machine; the TCP/FTP service on MTS has only been usable for a few months.

The MTS hosts are used by literally thousands of people, for quite a large variety of applications. Probably the most significant being electronic mail. Of course, since MTS doesn't deal with TCP/IP very well, it can't deal with Internet SMTP mail either. So, a long time ago, (two years, at least) our resident Unix expert kludged up a way for a Vax running BSD 4.3 Unix to "mooch" for the MTS host. That is, the vax answers any incoming connections headed to um and ub.cc.umich.edu. While the primary reason was to intercept SMTPs, it catches everything, which means incoming telnets, ftps, etc... (This was in the days before everyone ran mailers that used name servers, i.e., before the age of the MX record...) But, none of this is relevant to accessing the PC7 archives.

So - the PC7 archives physically reside on the um.cc.umich.edu machine, but must be accessed through its internet network interface, at him1.cc.umich.edu.

Perhaps sometime in the future, when this HIM stuff evolves past the
experimental stage, the um.cc.umich.edu address will point to the correct
machine. But for now, it doesn't, and that's about it.

Are you sorry you asked? }-)

Subject: Fatspeed help

I am posting this for a friend, so please don't get mad at me

Well 32 meg partitions can be done... and what more is GEMDOS will support it as I have tried it with the old TOS and Mega TOS 1.2....

The Supra h/d utilities will allow you to format up a hard drive with partition sizes up to 32 megs (maybe even more, i havent tried)....

Now you may say "Whats the Big Deal about having 32 meg partitions?", Well as you may know, GEMDOS presently will only allow you to have a maximum of 14 hard drive partitions....

What this means is that a maximum of 14 x 16 megs = 224 megs.... The maximum amount of hard drive storage under GEMDOS is 224 megs.... But since with the Supra Utils you can now go up to 32 meg partitions, this means the maximum hard drive storage addressable is doubled now to 448 megs..!

Now for the snag... anyone who has fiddled with h/d's will quickly notice how much it slows down when a partition fills up... Now with partitions at 32 megs, this slow down is incredible.... It gets to be slower than a floppy !!

Speed up prgs like FATSPEED have really helped to alleviate this problem..

But unfortunately FATSPEED does not work with partitions bigger than 16 meg.....

What I need is for the author or someone to Rewrite FATSPEED so that it will address 32 meg partitions, thereby eliminating the slow-down problem...

Anyone out there with any ideas????

Not all of us are on the commercial networks, and SoftLogik's pattern of
distributing software over them is pretty hard on foreign users. I've
been getting mailings of what appear to be demos, which seem a real
waste of their money, but then I hear that people are getting useful
programs from Genie and CompuServe. Does anyone have a good idea when
SoftLogik will put a WORKING version in the MAIL for those of us who
have ordered and paid for the update?

Message-ID: <13196@duke.cs.duke.edu>
Source record: 249891
Cross-posted to: comp.sys.atari.st,comp.lang.forth

Has anyone had any problems with ForthMacs on the 1040ST? I ftp'd
a copy from him1.umich.edu and have been playing with it. It does not
like to live in my Rambaby ram drive, if I make it >128k. If I have
<128k, it and Emacs runs ok... >512k, forth runs fine, but if you try to
edit, the system locks up. If you make it inbetween, I get bus errors
and the bombs... :-(

Does anyone have any ideas? I am new to the ST, so perhaps I am doing
something wrong. I have tried removing all desk accessories etc etc, but
to no avail. I like the forth implementation, but if it is going to crash
my box all the time, I don't think it is worth the $50 Mitch is asking for.
I would love to send him the money and get the docs, but only if someone
out there can convince me that ForthMacs is worth it....

Otherwise, it goes into the blackhole with all the other interesting but
useless programs I have accumulated.

Thanks in advance!

P.S. What do you _GET_ in the docs?? Is it more than just the source
for the VDI and AES stuff??? Is it a Real Document, as in, how to use
or just a list of commands?

Bob Currier

19. More about MicroEmacs 3.9 1/4

Newsgroup: comp.sys.atari.st
Date: 1989-01-03 01:05:51 UTC
From: rthurlow@van-bc.UUCP
Message-ID: <2089@van-bc.UUCP>
Source record: 249893

Well, I have a few more observations about MicroEmacs 3.9-and-a-quarter. I just tried to load a large file (the Stevie editor sources from comp.os.minix, all in one file), and I had some real problems. I tried first to load the file into MicroEmacs 3.9 1/4 launched from the Gulam with my 391K ramdisk and could not. "Well fine", I thought, "I'm pushing it a bit here. :-)" So I decided to turf the ramdisk and get some numbers.

First, booting my 1 Meg ST normally with no ramdisk and my normal desk accessories and AUTO programs left me with 870046 bytes free according to SCHIZO. MicroEmacs 3.9 1/4 reported that after it had loaded with no files that it had 736574 bytes available. But it was unable to load my 361409 byte file; it was only able to load 232785 bytes into the buffer before complaining that it had run out of memory. That's not very good in my books; where did the memory go? It may have been spent lavishly, but it seems more likely that the memory was just fragmented by that time.

By contrast, running the Gulam shell from the same 870046 byte baseline resulted in free space from within the editor of 775942 bytes. Gulam loaded the file easily, with 215730 left over for other buffers. And with the 391K ramdisk, Gulam failed, but could fit in just a bit more of the file than MicroEmacs 3.9 1/4 could!

The difference in overhead is very interesting to me; having 361K taking up 543K of memory is a whole lot better than having 233K taking up 737K of memory! Anybody have any comments about what is going on here? And can MicroEmacs 3.9 1/4 be fixed? I don't regularly edit files that big, but I do like to edit as many 50-90K USENET news batches as I can stuff in, and for that, it looks like I have to use Gulam. Of course, that's not such a bad way of doing things, either.

As for HyperCard, if you are sure that the chips are in right and everything is working fine then you have a System/Finder problem. I'm running HyperCard just fine using System 4.0/Finder 5.4. Try playing with the System/Finder - its not usual that they can be corrupted.

>
> --
> - John M. Logajan @ Network Systems; 7600 Boone Ave; Brooklyn Park, MN 55428 -
> - ...rutgers!umn-cs!ns!logajan or john@logajan.mn.org -
You are right. With RTS/CTS-On the CTS has to drop and come back for each
character.
The correct use of RTS and CTS is for MODEM control. RTS switches the sender
to on (In German: Sendeteil einschalten) and the modem answers with CTS.
By the way, the partner modem signals that by Carrier Detect (DCD).
You can (ab)use RTS/CTS for a oneway flow control on a line whithout modems.
And you can alter the conventions... so you have to jiggle...
If you want to use RTS/CTS in a correct manner on an ATARI ST, you have to
replace the interrupt serving routines of the TOS. I tried it in a program
written in MODULA-2 and in an assembler program for the AUTO folder.
In both cases I succeeded, so it is possible.

>Well, I have a few more observations about MicroEmacs 3.9-and-a-quarter.
<he goes on to describe some memory fragmentation
and usage problems....>

MicroEMACS was allocating line structures only in 16 byte
increments. This was very good for editing, not so good on storage.
By allocating only the needed # of bytes when the file is first read
in, and then allocating in 16 byte chunks when you first add a char
to a line, I seem to get the best of both worlds... an apox 30%
decrease in RAM usage. Look for this in the upcomming 3.10 release.

25. Fread system call

Newsgroup: comp.sys.atari.st
Date: 1989-01-03 14:34:41 UTC
From: RUBIN@POLYGRAF.BITNET
Message-ID: <8505RUBIN@POLYGRAF>
Source record: 249899

```
I am having problems using the Fread system call. This call will either
crash my system, or more likely result in 2-3, sometimes 10 bombs, depending
on the number of bytes I try to read. Using MWC 2.0, the code is similar
to the following:

h = Fopen(filename,0);
Fread(h,4096L,buf);

h is an integer, and buf is a 4096-character array.
The file is opened properly, but the Fread bombs. The file is binary,
if this makes any difference.

I would appreciate hearing from anyone who has successfully used the Fread
call and can help me out. Thanks...

Maybe in a perfect world they *should* do this, but in the real world there's
no way in heck they *can* do it. It's a no win situation for Atari, so
they have to take the "lose the least" option.

Who's going to fix the broken programs? Not the developers who aren't
in the ST business anymore. Maybe Atari? HA!

Some of the programs that would break come in Atari Corp. boxes, yet I doubt
if Atari would spend a single dime to fix any of them.

Like someone else said, I always try to follow the rules. Even so, ROM
changes can break stuff you didn't know was "TOS dependent". I solve
this problem by letting registered users download free updates from our
BBS. Many of the programs that would break however don't have anybody to
fix them anymore and there isn't enough new developmewnt going on to
replace all the programs with new software. And Atari can't afford to
lose any of the ST applications since there is less and less new stuff
coming out.

It would cost Atari money to solve this problem, so you can bet that they
will take the most inexpensive route which is to hack up TOS enough to
get improvements without sacrificing too much compatibility. Not a bad
choice really. This leaves the option of hoping a third party (somebody
elses money) develops a better OS, or if there's enough growth in the future
Atari could develop a real OS and make it an option, letting users know
that it might break old software. It's business, you know.

=Just on a side note. There are no hardware flaws with the ST. All
=the bugs are in software. I remember reading in another article that
=the hardware was hacked. I don't get it. THe hardware is all off the
=shelf, the system never crashes or behaves unpredictably due to
=hardware problems.
=--
=Phil Paone
=paone@topaz.rutgers.edu
=!rutgers.edu!topaz.edu!ppaone

good point, phil. the ST non-mechanical hardware is very solid. heavy use of drives will cause them to (eventually) fail, but that is true across the board (ibm, ST, amiga, etc).

TOS 1.0 and 1.2 (and equivalent european versions?) suffer from bugs, most of which only cause grief to developers: i wager the "average" ST user rarely sees any bombs (provided his application software is relatively well behaved). i doubt if that type of user (one who does not do "significant" programming in C/basic/et al) even sees the 40 folder bug.

please don't start a debate as to what "average" or "significant" means. there are a million or so STs, probably 500-2000 professional developers (i.e. those makeing $$ writing software on and for the ST), and probably 50% or more of the ST owners never even write a basic program. i admit i am just guessing, but it seems reasonable to expect the ST to have a user profile not much different than any other comparably priced ($200<price<$5k) system. most users of software in my particular market niche (music) only run applications from the desktop. the software in that market is generally robust and free from catastrophic bugs, albeit heavily copy protected (:^(.

Source record: 249804

Allan Pratt describes a fatal flaw in the above network software.

It seems very common that someone thinks a network for the ST is
easy and tries it. I have looked at several (at least five)
supposed "networks" for the ST. Some were supposed to eventually
be commercial products. I can't tell you how many times someone
has told me "Well Company X has a network for the ST - It will be
out in two weeks."

BEWARE! *NONE* of these networks have been even close to being real.

It is an extremely difficult task to make a useful general purpose
(i.e. remote file-system) network for the Atari ST. You can make
something look like it works, good enough for a trade show, with
little difficulty. You can also get special purpose networks running
like for transaction processing, or a controlled disk access (especially
read only), without too much work. But if someone tells you they have
a LAN-type network for the ST (or they're going to to have one real soon),
be *very* cautious.

The first one I saw was announced in 1985. It was never released. Since
that time I have seen many announcements of Networks for the Atari ST.
I have also seen many PD attempts. A lot of effort was put into everything
I saw, and I don't want to flame anybody who has tried it. This is just
a warning to would-be "believers" - be wary of ST network claims.

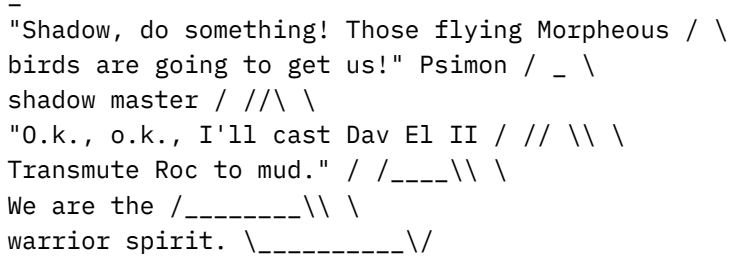
I am thinking about getting an atari. Why? cost. I plan to spend no more
than $2000. Should I be looking at amiga's?

I have one main concern. I want to be able to write C code that will run on a
unix machine. Looking through the magazines I have seen two C languages that
look good. Can anyone tell me about Mark Williams C and Laser C?



I have some questions about what kind of system I should get.

What is the difference between a 1040 and a 1040+?
What is the difference between a 1040 and a mega 2?
How much do the mega system cost and where can I get one?

I worked on a 520st with a development company back when the st first came
out (back when the os was all software, not on chips). How much has changed
since those days?

Is there an st running with the 68020 chip and what are the stats on the
STacey?

33. MWC/CSD bug?

Newsgroup: comp.sys.atari.st
Date: 1989-01-03 22:44:32 UTC
From: andyc@hplsla.HP.COM
Message-ID: <5440009@hplsla.HP.COM>
Source record: 249807

I'm having trouble with the -VCSD option in Mark Williams C, version 3.05.

The problem was discovered trying to debug a complex GEM application,
but can be demo'd with some very simple files:

foo.h - local include file that defines global variable "foo"
mod1.c - source module which #includes foo.h
main.c - another source module which #includes foo.h

The program compiles and runs when I compile with "cc mod1.c main.c".

However, with "cc -VCSD mod1.c main.c" there will be a complaint
similar to:

"ld: foo redefined in main.c"

The resulting object code does not run (hangs, warm-boot required!)
and CSD is all confused if I try to use it.

If I compile only one of the source modules with -VCSD the link is
okay and I can run CSD (but this means I can debug only one module at
a time, whoopee).

This doesn't happen when a header file like stdio.h is included in
both files.

So, somehow the extra debug stuff generated by -VCSD causes trouble in
the linker. Does anyone know of a workaround? (Yes, I'll be writing
MWC soon!).

Since several years I am working with VIP Professional and can
recommend it. It is said to be Lotus 123 compatible but I
cannot prove that because I never used 123. However, I bought a
textbook for 123 to get used to VIP Professional and havn't had
any problems.

I don't have the program at hand but I think the accuracy of
VIP Professional is about 13 decimal places or so. - With large
spreadsheets the calculation speed is boring. It seems that the
whole spreadsheet is recalculated even when only a single cell
has changed. I help myself with "manual" recalculation from
time to time.

Besides the pure spreadsheet functions VIP Professional has
macros and graphics (and a GEM interface).

>a warning to would-be "believers" - be wary of ST network claims.

This puts me in a difficult position - but nevertheless:

We have a transputer-based network connecting (at this time) seven STs
to (at this time) two servers up and running for over a year now. A
short description follows:

Introduction

The Atari network described here has been heavily used in our own
projects for a year. It provides multi-user access to shared disk space
using the familiar TOS interface.

The network utilises Inmos transputers with their fast link connections.
Work is currently being done to integrate IBM-compatible PCs into the
network and to implement an interface to the inter-user communication
facilities.

Hardware

The network requires at least one server. A server is an Atari ST (512
Kbytes of RAM are sufficient) with a harddisk (although in principle any
drive, including large RAM disks, could be used). It has the sole task
of handling requests from the network, thus managing access to its disk
data. A server Atari cannot be used otherwise while the network is in
operation.

There may be many servers in the network. All other network
participants are called users. A user thus is an Atari with or without
a local (non-server) harddisk, connected to the network via a so-called
Adapter Box which plugs into the ROM port. An RS424 line connects the
Adapter Box to a transputer. In this manner, the network can be
extended to almost any size.

Software

From a user's view, the network provides additional TOS drives, for
which the drive specifiers P downto minimally G are used. Drive

specifiers are assigned to disks or partitions of servers independently (and dynamically) for each user. The icon-driven desktop user interface is fully operational. A single file can be opened for reading by any number of users (if no-one has write access); however, a file can be opened for writing only if no other user is accessing it.

The user's computer gains network access by loading a resident program which redirects TOS requests for network drives. All TOS calls are supported; BIOS calls for network drives are not possible (and protection mechanisms therfore cannot be by- passed). A few new TOS calls for internal network purposes have been added. Network access can be dynamically de-installed.

Programs can be loaded and run from network drives (although they are actually executed on the local computer). Hierarchical inheritance of I/O-redirection and current paths are implemented in the usual manner.

If a user program crashes (bombs etc.), the network remains operational for other users. The crashed computer must simply be rebooted. It may however be necessary to explicitly close files which were opened on a server but not closed. Software support for this is provided.

Two additional programs allow users to have temporary exclusive access to the printer connected to the Boot Server. All printer output via DOS calls is then redirected to the boot server's printer.

As said, the network is *operational* (and, incidentally, will be on display at the CeBiT Hannover Fair this year), and we are quite happy with it. Mail me for more details.

>Has anyone had any problems with ForthMacs on the 1040ST? I ftp'd
>a copy from him1.umich.edu and have been playing with it. It does not
>like to live in my Rambaby ram drive,

First let me say that I am not a programmer, but an experienced user. Then I will say that I have several (4 or 5) versions of 4th for the ST and to my untrained eye Forthmacs looks to be a pretty good system. I think the problem you are running into is due to conflict with 4th memory location. In the manual it tells you how to move it around to wherever you want. i.e. hex 90000 memtop!
"" FORTH.TOS splice-relocation
"" FORTH.TOS save-rel
wil give you a version which runs with hex 90000 as its TOP address. Don't move too high as Emacs uses the space above MEMTOP. He goes on to say that you can find top of avail. memory with - base-page 1a1+ 1@ .
The Manual is about 1/2 inch thick and is mostly a complete glossary but also has advice on how to do things. There is a Macintosh Forthmacs and also a version for the Sun workstation, as well as a Gem Window interface for the ST which lets it run in windows and use them easily. Of interest to music people is Formula (Forth Music Package for Midi), very powerful but intended for programmers not casual musicians. With the complete kernel code ($$) is a metacompiler to let you prune uneeded words from a final product. Haven't corresponded with Mitch for over a year so would guess there is more now. Compared to the price of competing commercial systems Bradley is quite competitive in value for the buck.

(I don't have any connection to Bradley Forthware other than being a casual user. I just wish I had the time to become an 'experienced' user.)

39. Faster TOS upgrades?

Newsgroup: comp.sys.atari.st
Date: 1989-01-04 15:23:17 UTC
From: JOE@rcgl1.eng.ohio-state.edu
Message-ID: <1338@accelerator.eng.ohio-state.edu>
Source record: 249813

This is just a thought, and I'm in the mood to beat a dead horse.
But what would be the problem with a translator application. Atari
says (or do they?) that many things could be enhansed and speeded up if only
so many programs did not depend on illegal tricks. Well most of the mod's
i saw were the removal of time consuming things, and the like. Why not
write the code to enhanse TOS, then after you find out what was removed
or changed, write a short application with a file selector box. that
application could clear out memory and do whatever else the old operating
system used to do. It may not be easy (or maybe it is), but it certainly
is not impossible. Remember the various translators of old that made
an XL operating system into a 400/800 OS?

40. Help with SPECTRE 128, PLEASE!!!!

Newsgroup: comp.sys.atari.st
Date: 1989-01-04 16:49:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8901041651.AA23008@ucbvax.Berkeley.EDU>
Source record: 249814

I have tried calling Gadgets by Small and am told I will be called back; as yet ZIP! I am getting really frustrated not being able to run 128K requiring codes on Spectre 128. At my workplace there are more than 50 Atari computers with some groups running them as Macs under Magic Sac. Until I get at least one version of Spectre 128 to behave, no one is in a mood to order it. Please, please, someone help me figure out why 64K requiring codes will run but 128K requiring codes will NOT.

My Apple ROMS have the following numbers (at least this is what I can read):

752 SA X882Q 23512-1054 342-0341-C
751 SA X841Q 23512-1055 342-0342-B

I am running version 1.75 of Spectre 128. When I used Finder/System 5.4/3.2 my system bombed trying to run EXCEL 1.5 or HYPERCARD. When I used Finder/System 6.0/4.2 I got the message "The following application is busy or damaged:" then it named either EXCEL or HYPERCARD. C'mon, someone out there must know why I cannot run 128K requiring codes!!!!

If anyone knows how to get a message to Dave Small (I do not have access to BIX, GENIE, CompuServe or USENET) then please let him know that there is at least one poor soul who just cannot get Spectre 128 to run 128K codes.

One final note, the 64K codes that I run perform at blinding speed - disk access on my HD is incredible. Love it! Now, if only I could run EXCEL, HYPERCARD, ...

41. Picture Formats List

Newsgroup: comp.sys.atari.st

Joe Smith Greg Wageman Gerry Wheeler

Introductory information
------------------------
word = 2 bytes
long = 4 bytes
palette = Hardware color palette, stored as 16 words. First word is
color register zero (background), last word is color register
15. Each word has the form:

Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 0 0 0 0 R2 R1 R0 0 G2 G1 G0 0 B2 B1 B0

R2 = MSB of red intensity
R0 = LSB of red intensity

G2 = MSB of green intensity
G0 = LSB of green intensity

B2 = MSB of blue intensity
B0 = LSB of blue intensity

Intensity ranges from 0 (color not present) to 7 (highest
intensity).

Example: { red = 7, green = 3, blue = 5 } -> 0735 (hex)

Caveat: It is wise to mask off the upper four bits of each
palette entry, since a few programs store special
```

information there (most notably Art Studio).

The Formats

<NEOChrome>

1 long resolution (0 = low res, 1 = medium res, 2 = high res)
16 words palette
12 bytes filename (" . ")
1 byte Left color animation limit (starting color number)
1 byte Right color animation limit (ending color number)
1 byte color rotation speed
1 byte color rotation direction
1 word color rotation duration (number of iterations)
18 longs reserved for expansion
16000 words picture data (screen memory)

32128 bytes total

<NEOChrome Animation>

NOTE: To get this feature on versions 0.9 and later select the Grabber
icon and click the both mouse buttons in the eye of the second R in
the word GRABBER.
Interestingly enough, some versions of NEO only require you
to press the right button, not both. Hmmm...

1 long magic number BABEEBEA (hex) (seems to be ignored)
1 word width of sprite in bytes (always divisible by 8)
1 word height of sprite in scan lines
1 word size of sprite in bytes + 10 (!)
1 word x coordinate of sprite (must be divisible by 16) - 1
1 word y coordinate of sprite - 1
1 word number of frames
1 word animation speed (larger means slower)
1 long reserved; should be zero
----
22 bytes total for header

? words sprite image data (words of screen memory) for each sprite,
in order

<DEGAS>

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)

32034 bytes total

<DEGAS Elite (Uncompressed)>

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words animation channel delay in 1/60's of a second. [0 - 128]

32066 bytes total

<DEGAS Elite (Compressed)>

1 word resolution (same as Degas, but high order bit is set;
i.e., hex 8000 = low res, hex 8001 = medium res,
hex 8002 = high res). Other bits may be used in the
future; use a simple bit test rather than checking
for specific word values.
16 words palette
< 32000 bytes control bytes
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words animation channel delay in 1/60's of a second. [0 - 128]

< 32066 bytes total

Control byte meanings:

For a given control byte, x:

0 <= x <= 127 Use the next x + 1 bytes literally (no repetition)
-127 <= x <= -1 Use the next byte -x + 1 times
-128 No operation (ignore)

Compression Scheme:

Each scan line is compressed separately; i.e., all data for a given
scan line appears before any data for the next scan line. The scan lines
are specified from top to bottom (i.e., 0 is first). For each scan line,
all the data for a given bit plane appears before any data for the next
higher order bit plane.
To clarify: The first data in the file will be the data for the lowest
order bit plane of scan line zero, followed by the data for the next higher
order bit plane of scan line zero, etc., until all bit planes have been
specified for scan line zero. The next data in the file will be the data
for the lowest order bit plane of scan line one, followed by the data for
the next higher order bit plane of scan line one, etc., until all bit planes
have been specified for all scan lines.

<C.O.L.R. Object Editor Mural>

16000 words picture data (screen memory)
(palettes are stored in separate files)

32000 bytes total

<Tiny>

1 byte resolution (same as NEO, but +3 indicates rotation
information also follows)

If resolution > 2 {
1 byte left and right color animation limits. High 4 bits
hold left (start) limit; low 4 bits hold right (end)
limit
1 byte direction and speed of color animation (negative value
indicates left, positive indicates right, absolute value
is delay in 1/60's of a second.
1 word color rotation duration (number of iterations)
}

16 words palette
1 word number of control bytes
1 word number of data words
3-10667 bytes control bytes
1-16000 words data words

42-32044 bytes total

Control byte meanings:

For a given control byte, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 127)
x = 0 1 word is taken from the control section which specifies
the number of times to repeat the next data word (from
128 to 32767)
x = 1 1 word is taken from the control section which specifies
the number of unique words to be taken from the data
section (from 128 - 32767)
x > 1 Specifies the number of times to repeat the next word
taken from the data section (from 2 to 127)

Format of expanded data:

The expanded data is not screen memory bitmap data; the bitplanes are
separated and presented in columns. All the data for a given bitplane
appears before the data for the next bitplane. The data for each
bitplane appears as a sequence of columns, where a column consists of
one specific word taken from each line. For example, column 1 consists
of word 1 on scanline 1 followed by word 1 on scanline 2, etc.,
followed by word 1 on scanline 200.
To illustrate: The first data in the file will be the data for
bitplane 1, which consists of columns 1, 5, 9, etc., in order. The

next data will be the data for bitplane 2, which consists of columns 2,
6, 10, etc., in order.

<Spectrum 512 (Uncompressed)>

80 words first scan line of picture (unused) -- should be zeroes
15920 words picture data (screen memory) for scan lines 1 through 199
9552 words 3 palettes for each scan line (the top scan line is
not included because Spectrum 512 can't display it)

51104 bytes total

<Spectrum 512 (Compressed)>

1 word 5350 (hex) ("SP")
1 word 0 (reserved for future use)
1 long length of data bit map
1 long length of color bit map
<= 32092 bytes compressed data bit map
<= 17910 bytes compressed color bit map

< 50014 bytes total

Data compression:

Compression is via a modified run length encoding (RLE) scheme. The
data map is stored as a sequence of records. Each record consists of a
header byte followed by one or more data bytes. The meaning of the header
byte is as follows:

For a given header byte, x:

0 <= x < 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x < 0 Use the next byte -x + 2 times

The data appears in the following order:

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

Decompression of data ends when 31840 data bytes have been used.

Color map compression:

Each 16-word palette is compressed separately. There are three
palettes for each scan line (597 total). The color map is stored as a
sequence of records. Each record starts with a 1-word bit vector which
specifies which of the 16 palette entries are included in the data
following the bit vector (1 = included, 0 = not included; i.e., stays
the same). The least significant bit of the bit vector refers to
palette entry zero, while the most significant bit refers to palette
entry 15. Bit 15 must be zero, since Spectrum 512 does not use palette

entry 15. Bit 0 should also be zero, since Spectrum 512 always makes the
background color black.
The words specifying the values for the palette entries indicated in
the bit vector follow the bit vector itself, in order (0 - 15).

<Animatic Film>

1 word number of frames
16 words palette
1 word speed (0 - 99; higher value is faster)
1 word direction (0 = forwards, 1 = backwards)
1 word end action (what to do after the last frame)
0 = pause, then repeat from beginning
1 = immediately repeat from beginning
2 = reverse
1 word width of film in pixels
1 word height of film in pixels
1 word version number (major)
1 word version number (minor)
1 long magic number 27182818 (hex)
3 longs reserved (should be all zeros)
----
32 words total for header

? words image data (words of screen memory) for each frame, in order

<MacPaint>

header {
1 long version number (if zero, entire header is ignored)
38 * 2 longs pattern data (anyone know how to use this?)
83 longs reserved
} (total 160 longwords for header)
< 51200 bytes compressed bitmap data

< 51716 bytes total

Bitmap compression:

The bitmap data is for a 576 pixel by 720 pixel monochrome image.
The data is stored as a sequence of records. Each record consists of a
control byte followed by one or more data bytes. The meaning of the
control byte is as follows:

For a given control byte, x:

0 < x < 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x <= 0 Use the next byte -x + 1 times

There are 72 bytes per scan line. Each bit represents one pixel; 0 = white,
1 = black.

> by a personnal letter (4 weeks).
> By the way, no reseller can obtain one here in France, so....

Data Pacific was selling the Translator One without a valid FCC
id number. The FCC made them stop production until they had a valid ID.
Data Pacific now has a valid FCC id and will probably resume sales of
the Translator One in the near future.

Data Pacific has a history of problems selling product in
Europe. Part of this was due to a bad choice for their distributor,
part is due to lack of interest in selling there. I don't know if they
plan to resume shipments outside the US or not.

43. Re: Problems de-arcing NULLFILL.ARC (Was: NULLFILL ARCed source)

Newsgroup: comp.sys.atari.st
Date: 1989-01-04 17:51:43 UTC
From: leo@philmds.UUCP
Message-ID: <907@philmds.UUCP>
Source record: 249817

In article <899@philmds.UUCP> I wrote:
| [uuencoded file removed...]
|
|I tried to uudecode and de-arc this stuff, but arc.ttp complains (I'm
|using version 5.21):

[etc...]

Thanks to Dennis Pixton I found the cause of the problem:
The preceding table used tildes for carets (~ instead of ^). Since
neither the Unix uudecode nor my own ST hack of uudecode knows about
translation tables, the resulting arc file was corrupt. Replacing ~ by ^
and again uudecoding solved this. Hmm, my uu[de|en]code needs revising...

B.T.W. anyone knows of a standard Unix uu[de|en]code (not the Dumas
program) that knows about tables? Ultrix's doesn't.

Leo.

44. Resource / fsel_input() problem (Was: where is gem desktop resource?)

Newsgroup: comp.sys.atari.st
Date: 1989-01-04 18:28:06 UTC
From: leo@philmds.UUCP
Message-ID: <908@philmds.UUCP>
Source record: 249818

The resource question asked lately reminded me of a problem (bug ?)
I had encountered using GEM, about a year or longer ago.

Using the resource functions (notably rsrc_load(), rsrc_gaddr(),
rsrc_free()) I can load resources that, for instance, contain object
trees like forms and menus. Nice.

Using fsel_input() I have a standard way for the user to search and
specify a pathname (directory and filename). Also nice.

But trying to use both in the same program failed; when an fsel_input()
was done after a rsrc_load() the resource tree contained garbage.
It looks as if fsel_input() uses the rsrc_load() function itself, and
since a program can only have one resource file loaded at a time (am I
correct ?), it put its own resource on top of mine.

I worked around it by saving the relevant data (button states) and
restoring them after the fsel_input() and a new rsrc_load(), but it
didn't seem very nice to me (having to reread the resource file, saving
/ restoring states etc.).

Anyone familiar with this particular problem? Is it a known bug /
restriction? Any chance for it to get fixed in a new GEM version?

Leo.

45. Re: Uniterm 2.0e in him1

Newsgroup: comp.sys.atari.st

Yes, Atari has to take the choice that loses the least. I agree 100%. I just don't agree with you what that choice is.

To quote my buddy Karl, "system software must evolve, and if it does not evolve, it hastens the eventual demise of the system". At some point you have to make a clean break with the past, or you lose everything.

48. Re: MWC/CSD bug?

Newsgroup: comp.sys.atari.st
Date: 1989-01-04 19:13:10 UTC
From: leo@philmds.UUCP
Message-ID: <909@philmds.UUCP>
Source record: 249822

In article <5440009@hplsla.HP.COM> andyc@hplsla.HP.COM (Andy Cassino) writes:
|I'm having trouble with the -VCSD option in Mark Williams C, version 3.05.
|
|The problem was discovered trying to debug a complex GEM application,
|but can be demo'd with some very simple files:
|
|foo.h - local include file that defines global variable "foo"
|mod1.c - source module which #includes foo.h
|main.c - another source module which #includes foo.h
|
|The program compiles and runs when I compile with "cc mod1.c main.c".
|
|However, with "cc -VCSD mod1.c main.c" there will be a complaint
|similar to:
|
| "ld: foo redefined in main.c"

It looks as if you try to define foo twice; that is not allowed in C,
although some compilers may be a bit more tolerant than I 8-). Your
foo.h entry for "foo" probably looks something like:

int foo;

The linker is confused and doesn't know which storage to use: that
created by the "mod1", or that created by the "main" definition.

The correct way is never to use include files for definitions, only
for external declarations (and symbol definitions and typedefs).

Short lesson:
An include file (module header file) is used to export the global
definitions of one module source file, or for common used definitions
(project / application wide, or standard header files). The file is
included by the defining module as well as by the modules that use the
external references. Don't use it for storage, either program or data.
End of short lesson (8-).

The best strategy (I think) is to declare foo in foo.h and define it in
one of the modules: typically the one that defines operations upon
it (note the difference between definition and declaration; I use the
K&R terminology). So if you put (mutatis mutandis) into foo.h:

extern int foo;

and in main.c:

int foo;

your problem should be solved. Yes, I know there are some compilers that don't like a extern reference and a definition of a variable in the same file; they're just broken.

Hope this helps - success!

Leo.

49. Re: MWC/CSD bug?

Newsgroup: comp.sys.atari.st
Date: 1989-01-04 20:22:15 UTC
From: apratt@atari.UUCP
Message-ID: <1289@atari.UUCP>

In article <5440009@hplsla.HP.COM> andyc@hplsla.HP.COM (Andy Cassino) writes:
> I'm having trouble with the -VCSD option in Mark Williams C, version 3.05.

> foo.h - local include file that defines global variable "foo"
> mod1.c - source module which #includes foo.h
> main.c - another source module which #includes foo.h

This is not strictly legal. K&R section 11.2, on p. 206 (near the bottom):

"[I]n a multi-file program, an external data definition without the
'extern' specifier must appear in exactly one of the files. Any other
files which wish to give an external definition for the identifier
must include the 'extern' in the definition."

Many compilers allow what you have done, and ANSI recognizes the "common
extension" that "int foo;" may appear in many source files and all refer
to the same storage, but strict ANSI C follows the quotation above.

(In fact, the .common directive of most assemblers is what takes care of
this situation: the linker ultimately resolves all these declarations to
refer to the same storage.)

50. ForthMacs, apologies

Newsgroup: comp.sys.atari.st
Date: 1989-01-04 21:00:21 UTC
From: currier@romeo.cs.duke.edu
Message-ID: <13208@duke.cs.duke.edu>
Source record: 249824
Cross-posted to: comp.sys.atari.st,comp.lang.forth

Several days ago I posted a request for help with ForthMacs for the
Atari 1040ST. I seem to have been overly critical, and wish to issue
the following retraction:

ForthMacs DOES work with no problems. The problem I encountered was with
the Ram disk software I was using, NOT ForthMacs. I was contacted by
Mitch Bradley (the author of ForthMacs) within 12 hours of posting.
He gave me a patch to "fix" ForthMacs to work with my ramdisk sw.
Please note that I had not paid any registration fees, so I certainly
was not entitled to any support from Mitch. I subsequently tried a different
ramdisk, and ForthMacs ran without difficulty. I highly recommend the system,
and will be sending Mitch my registration fee post-haste.

...and so Forth,

Bob Currier

I am surprised to hear you have had such problems with your power supply. I have a 520st that I purchased back in February of 1986. It has since served me quite well in the power supply area. I once heard a rumour that the power supplies on the earlier STs were flaky and that after a time, they would burn out the computer when the computer was turned on. The purpoted solution was to leave the ST on constantly, which was supported by many people on the net at the time. Since then I have left my machine on round the clock every day of the year except when I go away for more than a day. I have had no problems with the power supply what so ever. Recently, I put my ST into storage because I had the opportunity to bring home a 1040 that had a blown monitor that some of you may have heard of. I have noticed that the 1040 gets quite warm after a few hours of uptime. As a result, I shut the machine down when I am done using it.

Is there any problem with leaving a 1040 on for extended periods of time as a result of the power supply getting too warm?

I claimed that the Atari ST was worse than the C=64, because with benefit
of more experience and they (The Tramiel Bunch, now called Atari) still went
with a unique proprietary O/S (GEMdos, from Digital Research).

In article <428@ho7cad.ATT.COM>, mgh@ho4cad.ATT.COM writes:
> Either you never owned a C-64 or have a very short memory. The C-64 is no
> comparison to the ST. If anything it has a tough time being considered the
> equal to the Atari 8bit line.

This is true, and I'll give you the Apple-II as well. But then this is also
true of the Atari ST. The Jay Miner Bunch (Amiga) are still ahead of the
Tramiell Bunch, and the Bad Apples (Apple) have less desirable hardware but
make up for it in other areas.

Now, I continue with:
> > Programming on the ST is exactly like programming on the IBM-PC, except that
> > there are fewer tools available, and more bugs to work around. After a couple
> > of months of struggling the ST went into storage and I financed an Amiga.

> I can only guess that you do not have any good software stores avaiable to you
> that sell ST software.

I don't know. Is the Floppy Wizard in Houston good? They seem to have plenty
of titles. The ones I saw and tried out were almost all toys. Dave Beckmeyer's
shell was the one exception.

> I find lots of programming utilities available for the ST.

As many as on the IBM-PC? (go back and read what I said, above). If you want
to compare the Amiga to the ST, can you run PM while debugging a multitasking
MIDI utility or a well-behaved videogame? Where's the source code debuggers?
How about REXX? Or the midi.library? You couldn't *write* a program like the
midi library on the ST. On the Amiga it's shareware.

> Far more than I can find for my Amiga.

What do you need? I'll be happy to help you find some. I find Fred Fish
supplies most of my needs, though. Most of my software budget, such as it
is, has gone to Manx.

> My main source for utilities for the
> Amiga is thru mail order and not local software houses.

I don't buy anything but games from local software houses, even when they have
the products I want. Simple economics, coupled with the fact that I know more
about the product than they do... on any machine.

> As far as comparing the two machines op sys, I find GEM totally superior to
> Workbench. It is much more friendly and easier to work with.

That's why I wrote Browser.

I'd like to thank everyone for flooding the net with their ftp problems the week I had finals and during vacation. The only time out of the whole year that I don't follow the net... Anyway, I was going to respond to everyone individually, but I think I'll do it this way...

Presenting....

Jon Brode's Him1 Cookbook

The PC7 archive is stored on an IBM 3090-600e mainframe. It uses an ugly, awful, old operating system called MTS. It doesn't like talking to un*x machines and such, as a matter of fact it couldn't until our systems group installed the HIM, the host interface machine. We have two of them, but only the first one is available for anonymous ftp. This ugly little kludge has been just recently installed, thus it is still buggy. If you have trouble connecting or trouble with dropped connections, that's the problem. When that happens, try again later when the HIM is in a better mood.

We used to run this archive on Clio and Euterpe. They are Suns and were nice machines to ftp to. Unfortunately, there were some problems with using those machines, so we had to move to the 3090.

You can only access PC7 (the name of the archive) if you have ftp. We'd like to set up mail access, but we're having some problems with that. Anyway, if you have ftp, type 'ftp him1.cc.umich.edu' or 'ftp 35.1.1.43', some systems prefer one over the other, but they both get you to the same place. Once you are connected, our system will prompt you for a name. Type 'anonymous'. Then you will be prompted for a password. Type whatever you want, it's not picky. Then you will be given a nice 'ftp>' prompt. Congratulations! You have just entered the realm of MTS.

That will put you in the directory of the FTP account. There's nothing there, you will have to change to the PC7 directory. Type 'cd pc7:'. That will put you in our directory. Actually, directory is a misleading term because MTS doesn't have a hierarchical filing system, thus all of our files are clumped together into one huge mass. We don't like it either, but there's nothing we can do about it. If you want to see all of the files that we have, type 'ls ?'. Note: MTS uses a ? as a wildcard, not a *. This will flood your screen with filenames. To get a more manageable listing, use a prefix with the wildcard characters. For example, 'ls disk?' lists all of the filenames that start off with the letters 'disk'.

Unfortunately, our mainframe limits us to 12 character filenames, which means that they aren't all that descriptive, but luckily allows us to name them with ST compatible names. If you want to find out what the files are, you could read the '!index' file. The only problem is that it is pitifully

out of date, but this should be remedied over Winter Solstice vacation. Until then, you'll just have to try to get along with the file names. Incidentally, this file is not binary, do not try to transfer it as such.

And now, the fun part, how to get our files down to your local system. After you've 'cd'ed to PC7, and found the file you want to get, type 'binary'. This will let you transfer the arc files properly. You *must* set binary when you ftp arc files. To get the file you want, type 'get filename', where filename is the name of the file you want. Then you can sit back and wait for the transfer to complete. There is a command called 'mget' to let you get multiple files. Remember when you use it that the MTS wildcard is ?, not *. Some ftp implementations have a 'hash' command that lets you know how much has transfered. Other ftp implementations have a 'bell' command that beeps at you when your transfer is complete.

Now comes the tough part, transfering the file to your ST. There are many, many ways to do this. The most popular seems to be kermit, so I'll describe how to use Uniterm's kermit. Ask you local sysadmin how to run kermit. Then, make sure that you have parity and stop bits set properly on both sides. If they aren't, you'll get bad CHK's and other nasty errors. After that, type 'set file type binary'. (On VMS systems, you have to set file type fixed, instead of binary) Then type 'send filename', and things should be set on that side. From Uniterm, hit Alt-T and click the box that says binary. Then click the box that says 'receive' and supply the fsel box with a filename. From there you can sit back and relax again.

Once you have the file on your ST, you have to unarc it. Most of the files on PC7 were arced with the old version of arc, but a lot of the newer stuff is done with the new version. To unarc the old stuff, use dcopy, to unarc the new stuff use arc 5.21b. Arc 5.21b will unarc the old stuff too, but dcopy is *much* faster.

That just about wraps it up, folks. If you have anymore problems, send me some e-mail. If you want to say hello, send me some e-mail. If you want to compliment the fine job (IMHO) that I'm doing, send me some e-mail. If you want to flame me or complain, I'll give your name to my father, the IRS auditor. :-)

Very quickly - call J&R Music and Computer in NYC, they *will* mail order Atari computers. Last time I checked they were asking $1,299 for a Mega 2 mono system. Then contact Software Distributors of America (found on CompuServe and GEnie) and buy a Supra 30 meg drive $649. If you want one buy an extrenal SF314 DD drive for another $200 (really unecessary with the HD.) You've just spend a little over $2,000 and have one of the most powerful packages out there. C programming on the ST is a breeze and both Mark WIlliams an Laser are excellent. There is no such thing as a 1040+, The Mega 2 runs faster than the 1040 and has the blitter chip which makes a big difference in the speed of grpahic displays. Add another $400-500 for Spectre 128, a set of Mac Plus ROMS, and Happy's Discovery Cart and you have a premire Mac Plus emulator to boot that runs all major software packages at speeds that are *faster* than a real Mac Plus or SE. Strong rumors are also out that this year will see the intro of a hardware add on box for the ST that will allow AT emulation at 100% speeds. Enough said - enjoy!

Pete

what is the slowest memory that the atari st can use without adding more
wait states. i've got 768K of rather slow memory (> 200ns access time i think)
from an old machine that doesn't really work too well, and could be put to
good use as expansion ram for the st. or do st memory expansions need to be
in increments of 2M??

also, is there a good reason atari decided to make the cartridge port a READ
ONLY port. it makes designing extra interfaces a REAL pain in the but. like, i
haven't seen too many ROM cartridges (except the vt100 cartridge, and even that
is not too hot), and virtually all cartridges out there require some way of
writing to the cartridge port (ie: clocks, ram-disk cartridge, digitizers, etc)
(maybe if atari sold kits that would give a 1040 an expansion port just like
a mega st!!!!) :-)
(that would be as nice as the "promise-lan", eh atari?) :-) :-) :-)

> As far as comparing the two machines op sys, I find GEM totally superior to
> Workbench....

Neither the GEM desktop on the ST nor the Workbench on the Amiga have anything
to do with the operating system:

Amiga ST Mac IBM

User Workbench GEM Desktop Finder COMMAND.COM
interface or
(shell) CLI

User Intuition GEM Toolbox none
interface
(library)

File system AmigaDOS CP/M-68K MacOS MS-DOS

Operating Amiga EXEC none none none
system
(kernel)

Library Amiga EXEC none Resource none
manager manager

Operating Libraries D/As D/As TSRs
system Drivers Resources
extensions Handlers

Multitasking Inherent Third party, Multifinder Windows
partial. Switcher Third party,
partial.

I can add that the spreadsheets are compatible in both directions.
About a year ago, someone posted a Lotus spreadsheet and I renamed
it and ran it under VIP. Later, I took one of my VIP spreadsheets
and transported it to a PC running Lotus. I got the same results.

The arithmetic gave the same results, but this was not intended to
be a detailed test of the arithmetic. I hope this helps.

Source record: 249835

I have used VIP for some time. It comes in 2 versions, GEM and Non-GEM. I have both but use only the non-GEM version. I am a constant user of 123 on a PC during the day so I like the familiarty of the interface. It is an exact clone of release 1 of 123. Reads and writes .WKS files with no problems as I often ship files back and forth from the PC to the ST.

As for performance, the Recalc speeds seem about equal to those on an 8086 based PC at 6Mhz. Screen draws are noticably slower but not irritating unless you have a lot of the area of the screen reversed via a Range operation. I use the advanced features of VIP(database, macros, etc.) heavily and have not had any problems. The main deficiency in VIP is it's graph handling capabilities. The screen graphs are inferior to 123 and the printed graphics only support Epson printers. Not having an epson printer, I have never used the print graph program.

Early versions of VIP were pretty buggy. The latest version which I got on an upgrade in May 1987 has few bugs that I am consciously aware of. Most have to do with what is put on the screen after executing a /WWH command or a /WT command in some circumstances. The /WWH bug has a workaround(move the undisplayed column off the screen and then move it back). The /WT bug is only a minor irritant.(It displays the wrong row number on the screen.) I would highly recommend it if you are looking for a 123 compatable spreadsheet.

> Finder/System 6.0/4.2 I got the message "The following application is busy
> or damaged:" then it named either EXCEL or HYPERCARD. C'mon, someone out there
> must know why I cannot run 128K requiring codes!!!!

The user doesn't have to do anything different to run an application that requires the 128K ROMs. In fact the programs you say are working (ones that work on 64K or 128K ROMs) are USING the new 128K ROM functions to run. They are just not using some of the new extensions to the Toolbox.

The message you are getting, "The following application is busy or damaged" normally indicates that the resource fork of an executable file has been damaged. Try re-copying the executables from your original Mac disk and see if that helps.

Gadgets by Small was shut down over the Christmas and New Years holidays, so they were not taking any calls. I don't know if they have caught up with the back log of tech support calls from the holidays or not. When I worked at Data Pacific I took a 10 day break over Christmas. When I returned I had over 200 tech support calls waiting for me and it took 3 weeks to get caught up. I'm sure that Dave has the same problem at Gadgets by Small or maybe even worse.

If you will send me a mail item with your name, phone number, and times you can be reached I will give it to Dave Small so he can call you.

Your terminology confuses me. In Atari parlance,

AES + VDI + GEMDOS + BIOS + XBIOS = TOS

Therefore saying "All TOS calls are supported" but "BIOS calls are
not possible" doesn't make sense.

If you mean GEMDOS where you say TOS, it makes more sense, and it will
work. The reason I said networks can't work is that GEMDOS will cache
sectors which might then change on the media, without GEMDOS knowing
that its cached sectors are out of date. If you reimplement GEMDOS
it'll work fine.

Please, nobody start the rumor that Megas are faster than 1040/520 ST's!

It's only because of the Mega ROMs, not because the machine is any
faster. In fact, I think new 1040s and 520s are shipping with Mega ROMs
(I could be wrong) so it won't be faster. (It'll be slightly slower: an
extra Megabyte to clear for each program load.)

The add is in the January 1989 issue of STart on page 95. It is an add for
Computer Repeats, Inc. There phone number is 1-800-347-3457. I just called
them and asked what the 1040+ is. It is a 520st with a 1meg upgrade and
an RF modulator so you can run it off your TV.

I also asked if they sell the Mega 2 and they do. The mono system is
$1299 and the color is $1499. Something just occured to me. I have been
assuming that the Mega 2 will run either color or mono depending on what
you connect to it but can it run either by simply change conections?

The prepended translate table seems to have been Dumas' creation, though I'm not too sure about that. (I've seen one other non-Dumas version that generated those tables.) But why not just use Dumas' code? I installed it on our Suns. I like the auto-split and include feature, as well.

>can that be true? Turbo c really exists?

Yep, Turbo C really exists. In Germany. With German documentation. Since
I can't read German, I've made no great pains to investigate further...
It would be nice if Borland would release it here in the US. Apparently
it's the fastest compiler yet, and produces the fastest code, by a pretty
good margin, from the numbers I've seen. And having worked with Turbo C and
Pascal on PCs, I'm pretty willing to believe 'em...

>Oh yes, let's get some terms straight.
>
> Amiga ST Mac IBM
>
>User Workbench GEM Desktop Finder COMMAND.COM
>interface or
>(shell) CLI

Fair enough, though you don't list "third party" here for the ST. Gulam is very powerful, and there's also the CRAFT programming environment.

>
>User Intuition GEM Toolbox none
>interface
>(library)
>
>File system AmigaDOS CP/M-68K MacOS MS-DOS

Actually, I'd say the ST filesystem looks identical to MS-DOS. I suppose we can let that slide, since MS-DOS evolved from CP/M anyway...

>
>Operating Amiga EXEC none none none
>system
>(kernel)

You're being somewhat of a bigot here. An operating system manages system resources on behalf of a user, as a most basic definition. Since all of these machines have, at the very least, code to allocate memory, control access to physical devices, etc., then by definition they do have operating systems, however limited or primitive. The ST has somewhat more comprehensive a system than either the Mac or PC, since it also utilizes memory protection and tries to maintain a distinction between user and supervisor mode. I don't know enough about the Amiga to compare, though it obviously must also support these features or else the much-crowed-about inherent multitasking would be a crock.

>
>Library Amiga EXEC none Resource none
>manager manager

Please define library manager. I've seen the Mac resource manager. It's an interesting idea, but intolerably slow. I suppose it corresponds to the Apollo library manager, or MACH's shared libraries. Dynamic linking is definitely a nice thing. There's a "third party" PD package that implements this on the ST, which seems to do the trick very nicely. As such, I find this "none" entry for

the ST to also be incorrect.

>
>Operating Libraries D/As D/As TSRs
>system Drivers Resources
>extensions Handlers

You fail to mention MSDOS device drivers. Shame shame shame. TOS also allows for TSRs, which is basically what device drivers are. Just because the folks at Atari aren't pointing things out to your attention doesn't mean they don't exist. In this case, I think your own words are somewhat appropriate - "programming an ST is like programming a PC." The same techniques, or ideas at least, apply. I suppose, before going much further, you should also define your terms some more - what do you mean by "libraries, drivers, and handlers"? I'm assuming you're using terms specific to Amiga parlance, and not just the usual meanings of "device driver," in which case I would say "driver" and "handler" were synonymous.

>
>Multitasking Inherent Third party, Multifinder Windows
> partial. Switcher Third party,
> partial.

This would follow, given your assertion that the Amiga has an operating system and none of the other machines do, since multi-tasking is a feature of an operating system. However, your entries here would tend to conflict with the previous entry. Too bad.

Also, the ST operating system is really more than you would lead others to believe. It's called GEMDOS, after all, to imply that the graphics environment aspect is really intrinsic to the system as a whole. And though the GEM desktop is simply a user interface, the Graphics Envuironment Manager is really a part of the operating system, and performs ("partial") multitasking management. Inherently. I grant you that it's very limited, but it provides most of the features one would expect from a full multi-user multitasking system, including IPC primitives and job control.

Not to say that things are all perfect or wonderful in the ST world, but they're certainly as crippled as you make things sound. There's a lot of delay loops in TOS that would have to be rewritten before it could handle multitasking more flexibly. There are lots of things I'd like it to do that it doesn't, but it's not impossible to implement these by oneself.

Finally, much of this is only of great import to a hacker. An application user doesn't care if GEM is the operating system or if a mouse click will generate an asynchronous interrupt to resume a suspended task. And for programming, there are few systems I've seen that provide a more powerful and flexible environment. Sure, it irks me that I can't pop up Uniterm while I'm compiling something. Big deal, it doesn't take very long to compile stuff anyway. Fast filesystems are nice that way. That's also an interesting point you fail to summarize in your table - the ST and PC disk I/O are probably the fastest around. I'd venture to say the Amigas comes in next, and the Mac last, though the Mac may very well be

faster for all I know. (I *know*, for a fact that the ST disk I/O is faster than the Amigas. Even with identical devices, like a freshly formatted Quantum 80S.) Even my Sun 3-260 with SMD disk controller is hard pressed to deliver the same kind of performance. (On second thought, no, it zips along pretty well too.)

Speed is something that's more commonly talked about, true? I mean, speed is noticed by anyone, hacker or application user. And while an ST may not be faster than an AT clone with 20MHz 80286 installed, it's easily the fastest of the three (ST, Mac, Amiga). I suppose I could spend the bucks for an Amiga 2000 with 68020, but I'd still be stuck with a machine with slow disks... (And when you're compiling code, it's disk speed that matters, unless you happen to be using Turbo C or something...)

77. v02INF1: Introduction to comp.sources.atari.st

Newsgroup: comp.sys.atari.st
Date: 1989-01-22 22:44:55 UTC
From: koreth@ssyx.ucsc.edu
Message-ID: <6059@saturn.ucsc.edu>
Source record: 249098
Cross-posted to: comp.sources.atari.st,comp.sys.atari.st

```
Submitted-by: koreth@ssyx.ucsc.edu (Steven Grimm)
Posting-number: Volume 2, Info 1
Archive-name: intro

This is the first of two introductory articles about comp.sources.atari.st.
This one describes how to submit source to the newsgroup, where the
archive sites are, and how to contact them. The companion article lists
all previously-published sources.

I am always looking for suggestions on how to improve the usefulness
of the newsgroup, and can be contacted as listed below.

-- Steven Grimm

--------------------

Subject: Submitting source for publication

Items intended for posting or queries and problem notes should be sent to
atari-sources@ssyx.ucsc.edu. If you are on a UUCP-only site, you can send
them to ucbvax!ssyx!atari-sources.

If you want verification of arrival, so say in a cover note, or at the
beginning of your submission, if it is small. I try to verify that a
program works, and if I can't get it to work, I may hold up posting it
for a couple of days. Please note that, except in rare cases, source
without documentation will not be published. The backlog from receipt
to posting varies from one to four weeks depending mostly on the set
of submissions currently in my queue.

I prefer that you submit sources and binaries separately, as it's a
pain to separate them, and such submissions are invariably placed on
the back burner. Sources should be submitted in "shar" format unless
you don't have access to a shar program, in which case "arc" is all
right.

Please inform me of any special system requirements, and what development
environment was used, so that I can properly test your submission.

--------------------

Subject: The structure of comp.sources.atari.st articles

Each posting in comp.sources.atari.st is called an "issue"; there are
roughly 100 issues to a volume. The division is arbitrary and may vary.
There are two types of articles in comp.sources.atari.st: sources and
"information postings." They can be distinguished by the subject line:
```

Subject: v01INF3: Index for Volume 1 and other info

This first word in the title identifies this as the third info posting of volume one. Similarly, the subject line shown below:

Subject: v01i081: tossrc -- Source code to TOS

identifies this as the 81st source article in Volume 1. Large sources are broken up into smaller pieces, and have subject lines that look like this:

Subject: v01i082: VMS clone in ST-LOGO, Part03/08

Certain information about the system configuration required to use the program is given on the keywords line.

Keywords: MWC, Megamax, 1meg, high

This means that the program compiles with Mark Williams or Megamax C, requires at least one meg of RAM and only runs in high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

Alcyon - Alcyon C (included with Atari developer's kit)
MWC - Mark Williams C
Megamax - Megamax C
Laser - Laser C
Lattice - Lattice C
C - Any C compiler
OSI - OSI Personal Pascal
BASIC - ST BASIC (this is not a joke!)
uuencode - program is uuencoded (uudecode required to unpack)
arc - program is archived (arc required to unpack)
high - high resolution
medium - medium resolution
low - low resolution
1meg - needs 1 meg of RAM

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: david@bdt.UUCP (David Beckmeyer)
Posting-number: Volume 1, Issue 80
Archive-name: micro-rtx

The "Submitted by" is the author of the program. If you have comments about the sources published in comp.sources.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this source in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

Please try to use this name when requesting that sources be mailed to you. Also, note that the "part number" given in the title, and the archive name given in the auxiliary header need not be identical.

Since most archive sites run UNIX, articles are given UNIX-style filenames rather than ST-style filenames. I do try to limit filenames to eight characters whenever possible, though.

Subject: Reporting and tracking bugs and patches to postings

Most of the time, bugs and updates will be posted to comp.sys.atari.st. Sometimes, "official" updates from the author will be posted submitted to comp.sources.atari.st so that they are archived with the sources.

Since there is no easy way to apply source code patches on the ST, changes to a program often result in a whole new version being posted.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the sources I moderate, so don't send your bug reports to me.

Subject: Accessing the archives

At this time, there is only one site known to be keeping an archive of comp.sources.atari.st. If you are making an archive available to the public, or would like to, please contact me.

Subject: Listing of archive sites in no particular order

1. Site ssyx is running an archive server, which automatically answers mail requests. Send mail to archive-server@ssyx.ucsc.edu with the word "help" in the message body for more information. Both the sources and binaries groups are archived on ssyx.

78. Viruses, references and request for information

Newsgroup: comp.sys.atari.st
Date: 1989-02-14 13:32:37 UTC
From: davidf@cs.hw.ac.uk
Message-ID: <409@odin.cs.hw.ac.uk>
Source record: 249097
Cross-posted to: comp.sys.apple,comp.sys.atari.st,comp.sys.ibm.pc,comp.sys.mac,comp.sys.amiga

This request for information has been cross-posted to the appopriate machine groups in the comp.sys hierarchy, to comp.risks and to the virus-l mail list. My apologies to those of you who receive duplicate copies of this item.

Responses by email please, I will summarise any relevant information which is not of a sensitive nature for posting to the machine group.

A review of the threat posed to the security and integrity of microcomputer systems posed by self-replicating code segments
---

I am in the process of compiling information on existing computer viruses, with a view to the production of a technical paper reviewing the threat to system security posed by both present computer viruses and likely future developments.

To this end I would be very grateful for information on individual infections, preferably detailing the symptoms observed, damage caused and disinfection techniques applied. Naturally I am also interested in details of the operation of the viruses, although I appreciate the reticence shown by infected parties to disseminate any details of virus operation, on the basis that it could lead to development of further viruses.

The technical report is part of a Doctoral research thesis in computer security, and will be available in late May. Distribution of the technical report will be restricted to people who have a legitimate interest (ie systems managers, commercial concerns, research), as I expect to review the techniques exploited by viruses in a fair degree of detail at the BIOS/DOS interface level. The report will consider the techniques used by virus to duplicate, the ways in which viruses gain control of the computer system, the camouflage techniques adopted and a brief overview of the existing computer viruses. Finally the report will consider the likely development of the threat from viruses, and how this developing threat can be addressed by protective software in both virtual and non-virtual machine operating environments.

At the moment I know of the following viruses:

IBM PC MS/DOS
1. Lehigh variant 1 and 2 2. New Zealand (stoned)
3. Vienna (Austrian, 648) 4. Blackjack (1701, 1704)
5. Italian (Ping Pong) 6. Israeli variant 1 (Friday 13th, 1813, PLO, Jerusalem), variant 2, variant 3 (April 1st), variant 4

7. Brain (Pakastani) and variants 8. Yale

Also potentially variant of the Rush Hour and VirDem viruses developed during the CCC's work on viruses.

APPLE MAC
1. NVir variant A and B, Hpat 2. Scores
3. INIT 29 4. ANTI
5. Peace (MacMag)

APPLE II
1. Elk

AMIGA
1. SCA 2. Byte Bandit
3. IRQ

ATARI ST
1. Boot sector 2. Virus construction set viruses

Mainframe OS worms
1. Internet worm 2. DECNET worm
2. BITNET Xmas chain letter

I would be grateful for any information on these, or any other viruses. Reports of infection may be given in confidence, in which case they will only be used as an indication of geographical distribution of infection.

A summary of known viruses, their symptoms, geographic distribution and known disinfection measures will be posted to the list as soon as sufficient information is available to prepare an interim report.

As part of the paper I will also be reviewing the effectiveness of viral disinfection software, and would thus be interested in details of any software you use, its effectiveness, and availability.

Thanks for your time!

I apologise for any researchers whose articles I have not cited, in what is
currently an incomplete list of references. Hopefully, this article
will be of some use in providing a general list of viruses which have
affected computer systems in the past.

Thanks for your time, and I look forward to any information you can
supply me with.

Ps. for those of you interested in viruses their exists a BITNET special interest mailing list, <virus-l@lehiibm1.bitnet>, requests to join should be in the form of a message to <listserv@lehiibm1.bitnet> of the form:

SUB VIRUS-L

There is also a virus alert list for postings of discoveries and limited follow up information regarding new viruses, to join send

SUB VALERT-L

Finally, readers in the UK should send their requests to Heriot-Watt University's redistribution point at <virus-l-request@cs.hw.ac.uk>.

I have a vested interest in the UK sublist as I am currently administrator. There are also a number of servers providing viral disinfection software, including:

<listserv@scfvm.bitnet> (Mac software)
<listserv@lehiibm1.bitnet> (Virus-l backissues and IBM software)
<info-server@cs.hw.ac.uk> (UK archives, and virus-l backissues)

and the TROJAN-PRO entry on the RPICICGE server and associated TRICKLE servers for IBMs.

As I was reading this posting requesting information on virus, my cubicle mate passed me an interesting article on the subject. It doesn't get much into Amiga viri (sp?) but says alot about the PC and MAC. Article is "The Virus Cure" Datamation -February 15, 1989. Also saw an add for conference on viruses in Chicago, May 1-4, 1989, Hyatt Regency O'Hare 1-508-393-2600.

In article <14940@cup.portal.com> Bob_BobR_Retelle@cup.portal.com writes:
}I agree that this is a sensitive matter... the *ONLY* time I ever tried
}to surpress any Topic of discussion on GEnie was when the discussion of
}"Trojan Horses" got too close to discussing ACTUAL methods of destructive
}programming.. (the term "virus" hadn't yet entered into things..)

}Where do you draw the line...? Are we better prepared if we see what most
}destructive programs look like..? Or... can we possibly avoid future
}problems by surpressing this information now..?
}
}I'd like to see the source code for these "viruses", but who's to believe
}that *I* won't use them destructively...?

A point I haven't seen mentioned in any of these discussions:

All of the necessary information for constructing a virus can be found in
any advanced text on MS-DOS features and programming. Of course, it isn't
all conveniently gathered in a chapter titled "Virus Construction", but
the data is there for anyone sufficiently knowledgeable and interested in
finding and using it.

In light of the above, the idea that you can prevent the spread of viri by
not discussing them in public is ludicrous. You can't keep the
information out of the hands of the bad guys. The best you can do is
inform the good guys and help them devise methods to protect themselves.
To develop such methods, you have to know what you're up against.

82. Atari Mega4 for Sale

Newsgroup: comp.sys.atari.st
Date: 1989-02-23 20:19:56 UTC
From: rtb@ihlpf.ATT.COM
Message-ID: <7814@ihlpf.ATT.COM>
Source record: 249754
Cross-posted to: misc.wanted,misc.forsale,chi.wanted,comp.sys.atari.st

I am posting this for a friend, please do not call me.

For Sale: I am being forced to part with my 4Meg Atari ST because I need a machine that is compatible with the software that I use at work. The prices that I am listing for this equipment are what I could find in various Atari St publications from mail order houses. They are as close to reality that I could estimate. I have the following setup:
4Mega St Mono System $2000
Extra SF314 DS Drive $200
Monitor Master $50
Megafile 30 Hard Drive $700
Spectre 128 complete $279
Total $3229

I want $2500 for the complete setup. I am firm on this price and I want to sell the equipment as a complete set so I don't have to hassle with dealing with many different people. The only thing I would sell seperately is the Monitor Master because the buyer might not need it. The Megafile 30 and Spectre are still under warrantee. I have original receipts for all the equiptment and most of the original packing material. I can be reached via EMail at rogue!bjs or if that won't work, you can contact me at 312-810-6823 days or 312-416-3951 evenings. Bruce Scarlata

83. Two Atari Monitors, Monitor Master FOR SALE

Newsgroup: comp.sys.atari.st
Date: 1989-02-23 20:21:39 UTC
From: ronp@reed.UUCP
Message-ID: <11879@reed.UUCP>
Source record: 249755
Cross-posted to: comp.sys.atari.st,misc.forsale

This is sort of long so if you aren't interested, hit 'n' now.

^L

Atari SM124 Monochrome Monitor for sale:
12" Screen, Paper White Phosphor
Controls on right hand side:
power/volume
contrast
brightness
manufactured July 1987
security cable (permanently) attached

I purchased this monitor new in December 1987 and it has worked
flawlessly for me. In original box:

PRICE: $100 including shipping

Atari SC1224 Color Monitor for sale:
12" Screen, RGB
Controls on right hand side:
power/volume
contrast
brightness
manufactured September 1986
security cable (permanently) attached
RCA jack for sound output added, switch to turn off monitor speaker
added

I purchased this monitor new in December 1986 and it has worked
flawlessly for me. This is the Goldstar version of this monitor, I have
tweeked the brightness so that it is even sharper than the JVC versions.
The sound output is simply a RCA jack in parallel with the speaker; the
volume control determines the level. In original box:

PRICE: $325 including shipping

Also I have a Practical Solutions MONITOR MASTER switch box for sale:
This is the box that allows you to connect both monitors to the
computer and switch between them without having to unplug and plug in the
cables. It also has composite video and audio outputs. The composite video
output will not work if your ST doesn't have an RF Modulator (I think only
certain 520s had this.) I bought this new in June 1988 and it has worked
flawlessly for me. List $49.95, in original box.

PRICE $35 including shipping

I would prefer to sell all this together, so as an incentive:
PACKAGE DEAL: SM124 Mono Monitor $90
SM1224 Color Monitor $300
Monitor Master $30

Total Price: $420

Of course, I will sell individual componets, and will consider any resonable offers.

Reply via email, or call evenings (503) 771-4988

Michtron is the publisher of this package and carry it for a very reasonable price. As one of the authors of 220-ST I'd like to include that we are beta testing an update to 220-ST that includes Ymodem Batch file transfer and true blinking character attributes plus a number of user interface enhancements.

We are also in the process of porting the terminal emulation state machine to the Macintosh, in fact I'm typing this with the Mac version. This is a very complete VT220 emulation including downloadable character sets and User Defined Keys. The Mac version should also work with Magic Sac and 64K ROMs.

85. RE: SC1224 monitor troubles

Newsgroup: comp.sys.atari.st
Date: 1989-02-23 22:00:54 UTC
From: rick@jpusa1.UUCP
Message-ID: <1056@jpusa1.UUCP>
Source record: 249757

I wanted to summarize the messages I recieved concerning
the problems with my friend's SC1224 (Goldstar) monitor, but rather
than page through the horror stories, let me offer what looks like a
solution -
There's a company called Best Electronics in the 408 areacode
of california (San Jose, Sunnyvale) that carries just about anything that
they can get a hold of having to do with electronic problems (with Ataris).
Mouses, keyboards *and* the infamous thermystor (Labeled TH901) on the power
supply board inside the monitor that has conspicously blown on quite a few
SC1224's...
So for those with dead goldstar's who have determined that parts
are unavailable - give these guys a call!

Best Electronics - (408) 243-6950

NOTE: I have no connection with Best Electronics - But am just
a satisfied home-repairer. (Sorry if it looks like an ad).

> Thanks in advance for any help.
>
> Dan Crevier
> (dcrevier@jarthur.claremont.edu)

Well, you probably did not harm your boot sector, because SuperBoot
don't mess with this. But it looks like you damaged your directory or
your FAT.
If you damaged your FAT, there is a second copy of it on the hard
disk, so get a disk sector editor like Disk Mechanics (PD) and copy
the good FAT over the damaged one.
If the directoy is damaged... There is little you can do by hand.
I don't know how to help you. Try asking around. BUT: the files
that Superboot was renaming/copying while you shut off the power are
probably either in the \auto folder or in the root directory. So it
is probably only these dirs that need recovery.
Did you do a backup? There is a very fast utility called Meg-A-Minute
around (see back issues of Start).
I don't know anything specific about your hard-disk. What driver do
you use? Atari's or Supra's?

>'campatible to VGA and EGA' implies?
>
>Thanks in advance.
>
>Mingqi

CGA, EGA and VGA all stand for IBM's video interface standards, and each corresponds to an adapter card that IBM provided with various systems. The main difference between them is in resolution of the image and the number of colors available.

CGA (Color Graphics Adapter) was first available with early PC systems, and provides 16 colors and 640 lines X 200 lines of resolution. Most graphics- and color-oriented software written until recent years was written for this standard. Its character rendition is generally considered to be poor for text-intensive applications.

EGA (Enhanced Graphics Adapter) has gained popularity more recently, due to its superior character rendition in either 25- or 43-line modes, and greater graphics resolution (up to 640 X 350). EGA can also display 16 simultaneous colors, but these 16 are drawn from a palette of 64. EGA requires a monitor capable of handling the higher resolution is required for an EGA adapter card. EGA cards are generally fully CGA-compatible. Most business software and other recent software (including MicroSoft Windows) requires EGA.

VGA is the latest and greatest. It was introduced by IBM with its PS/2 line. It supports up to 640 X 480 resolution, and 16 colors frmo a palette of 256,000 (!) colors. Actually, one VGA mode supports lower resolution (320 X 200) with 256 simultaneous colors. The popular MultiSync or MultiScanning monitors you may have seen around are able to handle higher-than-EGA resolutions, and in some cases, VGA. Because of the higher clock rates and bandwidth required for VGA, VGA-compatible monitors use analog display technology instead of the TTL (digital) technology used before. The MultiSync monitors have two input connectors and can handle the two different output modes, depending on the adapter card to which they're connected.

It sounds like you're shopping either for a card or a monitor, so I suggest you take peek at BYTE February and March '88.

From: Jim McCabe MCCABE at MTUS5
To: INFO-ATARI16 at SCORE.STANFORD.EDU
Subject: C Compiler

My thanks to everyone who responded to my request for information
about the available C compilers!

Oddly, almost every piece of mail I received followed the form,
"I own MWC, which is great, but you'll probably want Laser C,
which I hear is also pretty hot."

Laser C looks like the right choice for me personally too, but it's
interesting to find so many MWC owners and so little Megamax users.

In message dated 3 Feb 89 07:28:44 GMT, C. Squibby Breyman, who
seemed to be pissed off by hardware problems, writes:
> I like my ST for small applications. I am not going to
> suggest that it even be considered for serious processing
> applications(computer music synthesis)
As I did not see the smile sign, I assume Mr. Breyman is doing some
bashing here. I'll not put here the figures of the North-American
MIDI market, but the ST holds about 35% of this market, more than
any competitor. Now, if you want some references, here are some
people who use our not-for-serious-user-computer just for that:

Fleetwood Mac (despite the name:-)), Pointer Sisters, Tangerine
Dream, Jean-Michel Jarre (of Houston mega-show fame).
I personally saw an ST be used in the street by musicians performing
at a festival, and the 1040's were NOT tenderly handled (and that's
a mild understatement). In 3 months of daily rough handling, no
problem showdd. And the ST's were already a year old. So don't blame
the whole line for a small percentage of bad sockets.

About quality control, I witnessed a spontaneous combustion of an
IBM PC-AT (IBM, folks! Not a cheap clone!) motherboard which fried
under our horrified gaze. It was 2 or 3 year old. Moral: even brand
computers can have faulty chips or mechanical parts.

About components quality: a few years ago, I was working at a chip
factory making 68000's under Motorola license. One day, a commercial
guy came to our technical support office, fuming: he had a discussion
with an Atari representative about a batch of 68000 CPUs
and he was furious because the price asked by Atari ($6 apiece or so)
was about the production price! He made us understand was he thought
about those toy makers who want to buy so cheap and therefore
sacrifice quality.
Then, a few days later, the same commercial guy had a meeting with
an executive from Apple. Serious company, high-end hardware, this would
be a grrreat contract....
The guy came back, almost crying. Apple wanted the 68000's at $5.50 apiece.
"Any similarity with real company would be a far-fetched coincidence."

Come on, Squibby, flame the ST for what it deserves flaming (mostly
week support from Atari), but recognize its good technical standing.

90. FTP, uudecode

Newsgroup: comp.sys.atari.st
Date: 1989-02-24 07:59:41 UTC
From: a360ad@blake.acs.washington.edu
Message-ID: <957@blake.acs.washington.edu>
Source record: 249762

Please help !
Could someone give explicit directions on decoding, downloading,
and de-arcing binaries and sources from FTP archive-servers?

I am using the current version of GULAM (1.03.04.05) with its
terminal emulator running XMODEM. I also have the most recent
version of UUE and UUD. My host machine at the University is
running BSD4.3.

Files which require the ST version of uudecode seem to work alright..
But when i have to concatenate split binaries on the host machine
... uuedecode them, and then download, de-arc them ... i often
get bad header errors or the docs are good but the program bombs...

An explicit explanation of the proceedure in downloading a file
received from an FTP site onto an ST and getting a program to run
would be immensely appreciated as I have been frustrated for
several months watching great programs slip through my fingers.

Posting to the net may help others who are in a similar bind.
Also, the address for the server in mich ?

Thanks in advance.

91. MUSIC software

Newsgroup: comp.sys.atari.st
Date: 1989-02-24 08:40:20 UTC
From: a360ad@blake.acs.washington.edu
Message-ID: <958@blake.acs.washington.edu>
Source record: 249763

About a month ago, a few people were wondering if there were
any good MUSIC sequencing programs available for the ST.
While a quality sequencer is of great value to many musicians,
a convincing and workable NOTATING system is the hunt of many.

A system which provides 64 track sequencing with real-time
notation with real-time editing with real-time midi automated
mixing and leaves you with 708K of RAM at boot-up time on a
1040ST... is called NOTATOR, the notation upgrade for C-LAB.
Virtually any possible editing that can be done, can be done
real-time. Both midi info and notation may be displayed
simultaneously. As a matter of fact, you can play and record while
watching your quantized score print to the screen!
The print out, though not laser yet, is very 24-pin professional.

I purchased my 1040ST in June of '86 specifically for my music
studio, as i make my living teaching and performing...
Having spent too many dollars on illogically-conceived
programs, i was ready to give up on the idea... but along
came NOTATOR, reason alone to buy an ST if you're a musician.

Frankly, music software available on the MAC and IBM rather
pale in comparison....

Those interested in more information about NOTATOR, MIDI-STUDIO,
HYBRID-ARTS EZ-Score and DR.T's and MUSIC STUDIO may contact me..
.. i've tried them all

OK, You trust me, and I trust you... what about all those 16 year old hackers out there "in the audience" that we both might not trust..?

>Yes, you are better prepared when you know what ALL (not most) viruses
>look like. Once you got one, you can easily identify it, write your own
>virus-checkers etc.

OK, maybe you and I can do this, and write our own "virus checkers" to protect ourselves...

But what about the computer "users" like my mother... or the print shop owner I just talked to today, whose hard drive was infested with a "virus" inadvertantly, and whose business was hanging in the balance..?

HE was lucky... he knew enough to be able to salvage his disks and HD.. but I seriously doubt he'd have been able to write his own "virus checker".. the customer whose disk had infected his HD certainly didn't, and the print shop owner was up until midnight, trying to "vaccinate" the customer's disks too...

I understand what you're saying, and I agree with most of it... but until we can guarantee that what we post here won't harm someone, somewhere, I still think that we should try to refrain from spreading this kind of knowledge...

I know that we can't totally "surpress" this kind of information, but maybe we can slow its progress... ?

93. ST Hard Drives

Newsgroup: comp.sys.atari.st
Date: 1989-02-24 09:37:32 UTC
From: neil@cs.hw.ac.uk
Message-ID: <2173@brahma.cs.hw.ac.uk>
Source record: 249765

We have just bought two more 1040ST computers complete with SM124 monitors and Megafile 30 hard disks. The odd thing is that the new computers only boot a new hard drive from power up but not an old SH204. Performing a coldboot will then boot up an SH204.
Both drives are using HDB to boot and are now using the latest version of AHDI that came with the Megafile30's. The 1040's have ROM version 1.02.
Has anyone got any idea (esp. Atari) as to why these new ST's are being so choosy about their drives. I suspect it is a revision of the ST hardware.

I promised long ago not to release copies of any virus anyone sent to me.
I still get several requests each month for copies, for all sorts of reasons.
I can understand the curiousity, but you just never know what might happen.
Some of them are not harmful, while others are very dangerous.

I happen to believe that keeping things secret is a good way to leave
users vulnerable, while making the viruses that much more effective. That's
why VKILLER not only detects and kills viruses, but will report on exactly
what any virus it recognizes will do.

It might not be a bad idea to post the characteristics of the viruses
I know about here. Perhaps a series of items, outlining one virus at a
time. I believe that information would be useful to anyone. If you're
not interested, I suggest the "N" key.

Please don't flood me with "Yes, do it" messages. I'll get started this
weekend, and start messages as soon as I can get them prepared at a level
that most people can understand.

Meanwhile, if anyone has turned up any that VKILLER didn't recognize,
forward a copy, and I'll add it to the program, and the notes to go
here. I will not send any copies (of the virus) anywhere else.

From: ferneau@silver.bacs.indiana.edu
Message-ID: <3268@silver.bacs.indiana.edu>
Source record: 249768

Has anyone found the time machine or the secret room(s) in the castle?
If so, could you please tell me how? I have gone through all of the
conventional rooms and have (I think) looked at everything and tried
most things to the objects. I believe that the cabinet/bureau in the
office downstairs has something to do with it. I think it has to move
and the lab is on the other side.

What does everyone think about the user interface? I think it is
poorly designed, difficult to use (as you have to try everything to
get some response it seems) and a waste of time. Granted, I would not
have bought the game if it was interactive text, but I was told that
the gameplay and user interface was much better than that of Captain
Blood, so I bought CQ and am very disappointed. However, my roommates
and I would still like to finish the game.

Thanks!!

First. So far, ALL ATARI disks seem to work with minix.
Second, I do not know if the MegaFile 30 shares the SH204 grief. It should
be easy to check; maybe someone on the new will.
-- Use any utility that will access drive 1 on controller 0.
Such as, hdx, Magic Sac, Spectre128, a recent utility in START.
-- If the program says the drive is there, but reads wrong, then that
is the SH204 problem.
Third, I would suspect that 30 megabytes implies an Adaptec 4070 RLL
controller. I would expect that another RLL drive could be added.
Maybe Adaptec will tell you if you can mix RLL and MFM drives.

There is a lot to say for clean prepackaged systems. And a Megafile 30 surely
is a cleaner package for non-hardware types that say the Berkely Microsystems
that I favor.

98. Beta Test Opportunity for Astronomy Program

Newsgroup: comp.sys.atari.st
Date: 1989-02-24 15:43:41 UTC
From: terrell@druhi.ATT.COM
Message-ID: <3948@druhi.ATT.COM>
Source record: 249770

New Astronomy Program Needs Beta-Testers:

If you're interested in beta-testing a new astronomy program for the ST, please give me a call. Mention your US mail address, telephone number, type of machine (e.g. 520, 1040, etc).

You must have a sincere interest in astronomy, but needn't be an expert.

Eric Terrell (303-450-7569)

99. A PD database???

Newsgroup: comp.sys.atari.st
Date: 1989-02-24 16:02:13 UTC
From: csrobe@CS.WM.EDU
Message-ID: <8902241602.AA21425@cs.wm.edu>
Source record: 249771

Greetings,
Is anyone aware of a reasonable Public Domain database management
system for the ST. Preferably, but not necessarily, one that can produce
dB files that can be read by one of the well known IBM DBMSs. I'm trying
to set up a database of "cruely-free" products for electronic dissemination.
So, it would save me time if it wrote a standard format (whatever that might
mean).

FYI: Cruelty-free products are consumer products, shampoos, cosmetics,
soaps, cleaners, etc. that were NOT TESTED ON ANIMALS and do not contain
Animal by-products. However this database will focus on the TESTING-free
products.

Thanks,
-c

>
>I didn't want my Roundtable to be the inspiration for some 16-year old
>"hacker" to "make a name for himself" by using the information in a
>destructive manner...

Viruses and Trojan Horses came into being long before there were
computer conferences. The solution to this problem is to educate
everyone about the nature of the beasts. Keeping thousands of
innocent computer users ignorant to prevent giving the information to
a handful of jerks who can (and do) get the information elsewhere
(sometimes by discovering it themselves) makes little sense.

>Where do you draw the line...? Are we better prepared if we see what most
>destructive programs look like..? Or... can we possibly avoid future
>problems by surpressing this information now..?

Suppressing the information??? What makes you think that you have any
control of this? The information on how to write a virus is present
in any detailed system manual. Any experienced programmed could write
a *killer* virus from the information in the Developer's docs. It
doesn't always take a statement like "boot sectors make great places
to hide viruses" for someone who's mind works that way to see this.
The only information you are suppressing is that of how the current
crop of viruses work, and therefore the means to stop them.

>I'd like to see the source code for these "viruses", but who's to believe
>that *I* won't use them destructively...?

It isn't necessary to distribute working virus source code to
everyone; what is essential is that the method of operation of the
virus be thoroughly examined by experienced programmers, and the
information disseminated. When the means of transmission and the hiding
places are known, it becomes simple to fight the disease.

Why not let "some 16-year old 'hacker' ... 'make a name for himself'"
by writing an *anti*-viral program? Why do you assume that the
information *will* be used for harm? You have a very cynical outlook
if that is the case. Is it, perhaps that you are just protecting
yourself, and the rest of us be damned?

Source record: 249773
Cross-posted to: comp.sys.atari.st,comp.sys.apple,comp.sys.mac,comp.sys.ibm.pc

In all of this discussion on proliferating information about viruses, it seems
that the proponents of free exchange of information argue that it is impossible
to keep the information from those who want to make viruses, while that
information may be helpful to prevent their spread. I would contend that
neither statement is true. Sure, anyone who is technically minded can find
the information in the manuals, but that is still a far cry from actually
finding source code listings in a magazine. When source code is distributed,
anyone with an assembler can make minor modifications to the code that will
make the "mutant" virus undetectible by current virus detection programs. This
requires neither very much work nor much understaning of the workings of
viruses. Thus, while some people will always be able to make new viruses,
it is possible to minimize that by restricting discussion. On the other hand,
I seriously doubt that publishing source codes is very useful for preventing
the spread of viruses. If a source code is published, then it already has
been disassembled and analyzed, and a method of detecting and removing it has
been found. All that needs to be spread is that method, or better yet, PD
programs to do the job, but not the actual source code for the viruses.
In short, I believe that the inevitable proliferation of mutants completely
outweighs the minimal advantages of publishing source codes. Best to keep
the discussion to how to protect against viruses -- not how to make them.

Just thought I'd put my two-cents in.

It seems that your `lc' is non-standard with respect to System V;
that's where it came from. On my Unix(tm) Box I have the alias:

alias lf 'lc -F'

which produces your `ls -F'. Ls -F tells you what's executable or
not, usually :-]. Under gulam I use a similar alias.

Have fun,

```
+------+
I need to sell my ST. The Price | $999 |
+------+

Here is what is included at this price:

1. 1040ST (1 Mbyte RAM, MC68000 processor, 1 Floppy)
2. SM124 monochrome monitor
3. 20 Megabyte Supra Hard disk (with loads of software)
4. QMI 1200 baud modem
5. Battery-backup for clock

The software included on the hard-disk includes:
1. Chessmaster 2000
2. Mark Williams C (v3.0) and CSD
3. various assemblers
3. Public Domain Forth, Icon, Lisp, Prolog
4. Atari BASIC & LOGO
5. 1ST_Word
6. Tempus (graphics text editor)
7. Gulam and other shells
8. Loads of desk-accessories

Recently, I checked mail-order prices and found that the hardware alone would
cost well over $1200 - but, I guess, their stuff is slightly newer than
mine :-)

This is just a guess, but...

The "template" which you insert between the MMU chip and its socket probably
bent some of the socket's connectors, so that they no longer make a reliable
connection to the chip. If this really is your problem, you can fix it by
taking a piece of wire, bending it to make a hook, and using the hook to
pull the connectors back into the proper shape.

(I had a similar problem once, and that fixed it.)

106. Zoo/ST status update

Newsgroup: comp.sys.atari.st
Date: 1989-02-24 20:00:11 UTC
From: daanjj@neabbs.UUCP
Message-ID: <107625@neabbs.UUCP>
Source record: 249778

Recently, I announced a version of Zoo 2.01 for the Atari ST. At that time, I had asked Rahul Dhesi, the author of the Zoo program, to relax his copyright restrictements for the ST version of Zoo. In the meantime, he has responded to my request and I'm now allowed to distribute binary and source separately. This is a big plus because the Zoo source is big, about 200 Kb (compressed).

For those of you who don't know what Zoo is: Zoo is a file archiver, in my humble opinion *much* better than ARC. Zoo is -roughly- twice as fast as ARC, and has several unique features. I name for example Zoo's built-in directory support: Zoo can be told to record both filename and pathname; it is even possible to let Zoo create any directory needed when extracting using full pathnames. Zoo even comes with a special utility, FIZ.TTP, which can be used to extract as much as possible from corrupted archive. Try that with ARC!

Zoo/ST has one new feature: is is now possible to place the contents of a complete directory tree in a Zoo archive. In this way, Zoo acts like a combination of the UNIX utilities "tar" and "compress".

The current version of Zoo/ST is very reliable: around 25 people are currently using it. I plan to keep Zoo/ST in beta test for another week to abandon most of the bugs (I expect they still exist 8-)

So, at the end of Februar, I will send the binary (size only 37Kb) to comp.binaries.atari.st and the diffs to comp.sources.atari.st. The general Zoo bugs I've found will be posted to comp.sources.bugs RSN.

Someone asked me if Zoo archives can be extracted and listed with the program Booz, which was posted to comp.binaries.atari.st some time ago. The answer is: Yes! Booz was only written because the Zoo source is spreaded in a Zoo archive, so one had to have a small extraction-only tool to bootstrap Zoo!

Finally, it's nice to remark that about 2 days after I uploaded a beta version of Zoo/ST to some Dutch BBSes, somebody started writing a graphical shell, much like the very popular ARCSH graphical shell for ARC. When this program is fully developed, it will be posted to comp.binaries.atari.st as well. Give "ZOOBOY" a few more weeks...

I'm interested in writing finnish dictionary for 1ST Word+ V3.0.
The problem is that to make a new main dictionary I would have
to remove all the words from spelling.dic by mergin a supplementary
dictionary with '-' sing preceding all the words to be removed.
This way it would work but I don't want to write 40000 words preceded
with minus sign. There must be an easier way!! I have also tried
to make a zero lenght file 'spelling.dic' but that didn't work either.
So is there anyone who has already written foreign dictionaries for
1st Word+. Any information would be greatly appreciated.

I should have written down the particulars....

I was in a local bookstore and there was a *BOOK* on computer viruses. This included chapters on history, types of viruses, different operating systems and included source code in several languages for some viruses. It also had chapters on security viruses and how to prevent and detect viruses. Anyone can buy this book and be dangerous now that the "secret" is out. Having written a couple of viruses myself I found the book informative and useful as far as it went. I even found a few things in it that I hadn't thought of.

I guess now we can discuss these things like we are reasonable adults?

"The death of God left the angels in a strange position."

There is an interesting parallel here between virus src code and _guns_.
If you make them available to everyone, then people can use the src
code to figure out ways to prevent attacks [_self_defense_]. But you
also open up the possibility that twits who wouldn't otherwise have
the ability to attack, get the code and create a mutant [_no_guns_for_
_the_insane_or_convicted_felons_].

The differences here are: You can't control who gets the src if you make
it public (EVERYONE gets it), and there are more people out there willing
to commit the almost unstoppable crime of mutation than there are those
who would actually kill someone with a gun.

Right now, any good coder with the appropriate manuals can write a
nasty virus if they REALLY want to, but Joe 16-year-old (mind | body)
who can barely understand assembly and knows nothing about the OS
is out of luck. Publish the srcs and, on a whim, he can write a mutation
either to attack his school computers or just for the hell of it, and he WILL.

The One True "lc" predates V7; it was invented at
the University of Waterloo under V6 (maybe earlier).
The 4BSD version has been posted to comp.sources.unix.

On Xenix, lc is a link to ls, and is effectively an alias for "ls -C".
This is probably a Xenixism, based on a Berkeleyism.
Why would anyone want their files sorted down instead of across?

If anyone is interested, I have a program that will download a
directory of softfonts into HP LJ + or series II compatible laser printers.
It's basically a modified version of the program BOOTCOPY that was posted
some time ago. It will either load fonts from a default directory called
HPFONTS, or you can specify the directory for it to look in. Very simple,
nothing fancy, gets the job done.

If you're interested let me now and I'll send it.

119. FTP

Newsgroup: comp.sys.atari.st
Date: 1989-02-25 23:38:48 UTC
From: a360ad@blake.acs.washington.edu
Message-ID: <969@blake.acs.washington.edu>
Source record: 249791

A few days ago, I left a message on the net seeking help
in uudecoding SPLIT binaries.

Again, i have no problem when i get an FTP file that is ONE file
complete....I get a hernia trying to cat SPLIT files and
uudecode, download and de-arc them. Typical errors are
"bad header... skipping (n) bytes "... where the docs look fine but the
program crashes. I should think there is a simple solution.

However, i have tried uudecoding both before
and after concatenation. In most cases, the splits have an
"include <filename>" at the end of each part. So it seems that
all one would need do is run uudecode on part one... and theoretically
the remaining parts should should be fed through the program.
In every case, uudecode only decodes the first file.... so i end
up emacsing each file... catting them etc.... this never works.

The university is running BSD.4.3. I am using XMODEM in
GULAM (1.02.04.05) on a 1040ST.

UUD.ttp works fine on UUE'd files (split). But because most FTP
files are UUDECODED, i get but to stare at some incredible resources.

Please, someone offer an explicit desription of the appropriate
procedure.

Much thanks in advance.

Message-ID: <8902260313.AA04419@ucbvax.Berkeley.EDU>
Source record: 249792

I have been experimenting with programming using GEM calls and I ran into a problem I cannot resolve. I tried to set up a dialog box as follows:

```
--------------------------------------
<-- Obj_Type=G_BOX
Obj_Flag=NONE
Obj_State=NORMAL

---------------
Click Here <-- Obj_Type=G_BOXTEXT
---------------------------------- Obj_Flag=EXIT
Obj_State=NORMAL
```

The G_BOX object is the ROOT where:

Obj_Next=-1 Obj_Head=1 Obj_Tail=1

The G_BOXTEXT is the child where:

Obj_Next=0 Obj_Head=-1 Obj_Tail=-1

I want to display messages within the dialog box and have the user skip to the next message by clicking on the G_BOXTEXT object. The problem I am having is that I cannot figure out the parent-child-sibling relationship of the G_TEXT objects that I will have to place within the G_BOX object. Would the new G_TEXT objects be children of G_BOX? What values for Obj_Next, Obj_Head and Obj_Tail would I use for these additional objects? HELP, I am stuck!

122. comparison of assemblers

Newsgroup: comp.sys.atari.st
Date: 1989-02-26 02:14:31 UTC
From: ins_bjjb@jhunix.HCF.JHU.EDU
Message-ID: <879@jhunix.HCF.JHU.EDU>
Source record: 249794

I would like to have some users' comments about the various assemblers available for the ST. Specifically, I'd like to know about DevPac 2 as compared to AssemPro. I'd like to hear about the MetaComco assembler, too, of course, but I already get the impression it isn't in the same class. And, also of course, if you know about any other terrifically wonderful assemblers that are available, I'd be glad to hear about them.

To give an idea of my requirements, I've never done M68000 assembly (although I've done entirely too much for the 8088), the only debugger I have is the one which came with my Lattice C compiler, I have editors up the wazoo (and use Tempus because it's God's gift to programmers), I want GST object file output because a) I have Lattice C and b) I don't have the developer's-kit-type linker (I can't remember the name at the moment, LINK68 ?) (although if any of these include a linker which can handle LINK68 format object files, that would be great, too), and (is this requirement really meaningful now?) I want macros, macros which can be nested, if possible, with unlimited arguments, if possible, and with the ability to just spit out gobs of money with each compilation, if possible. Speed is relatively important (when isn't it?) and my budget allows for no more than $75. One last requirement: The manual must be informative -- a detailed description of each opcode would be nice. I'd rather not have to spend another $20 on one of the M68000 programming books... But if you can specify a nice, cheap assembler, and tell me about a good reference, that might fit the bill, too.

Thanks in advance!

```
>
> Can any netter tell me what differecnce VGA, EGA and CGA make and what
> 'campatible to VGA and EGA' implies?
>
CGA = Colour graphics adapter.
Likje a monochrome display adapter with 160x100 16 colour,
320x200 4 colour and 640x200 monochrome graphics. Colour registers
exist on CGA and EGA with 6 bits for each colour which define the physical
colour displayed for a given colour number.

EGA = Enhanced graphics adapter
Can emulate a CGA to an extent - some clone boards emulate CGA
properly - as well as a 640x350 monochrome, 640x350 16 colour. Text is
much easier to read on EGA than CGA

VGA = Video Graphics Adapter
Can emulate EGA and CGA - most can do so fully. Some also emulate
MDA and Hercules. Ideally you should try to get one which has full register
level downward compatibility with CGA and EGA. Text modes are enhances by adding
an extra 50 scan lines (350->400), and there are 3 new graphics modes -
640x480 2 colour, 640x480 16 colour and 320x200 256colour. There are 64
... oops 256 colour registers each with 24 bits, although only 18 bits are
used, with 256000 possible colours and shades. Most modes can take advantage
of this. Some cards have additinal modes including:
132x44 text, 132x25 and 132x28 all with 4 colours
1056x352, 1056x350, 1056x364 all 16 colours
640x40 800x600 256 colours
024x768 16 colours

Yes, what you describe is exactly what happens to me. I don't have any idea what causes it, but the problem never occurs if both drives are turned on before the ST. I guess after recognizing the problem (and screwing up several disks!), I have just been living with it, but I too would appreciate knowing what causes it.

UUENCODE and UUDECODE are programs written originally for Unix systems.
UUD and UUE are enhanced versions of the above, available to run on the ST
or on Unix (BTW, does anyone have the Unix versions available?). UUENCODE
and UUDECODE are very basic, and allow only one file at a time, without the
ability to chain from one file to another, which UUD and UUE can do, via
the 'include' statement. UUD/UUE also have some very elementary error
checking. The reason a file is split is because some mail systems have a
64K limit per posting. To decode split files using UUDECODE you have to
edit each piece, removing any header information in all but the first file
in the series. When done, the first file will have a 'begin', and the last
file will have an 'end'. CAT all these files together. UUDECODE the result.
Send me some mail if you have any more trouble.

If you were to use Word Perfect, you might be able to get an already existing
Finnish dictionary for the IBM, and use it on the ST. As far as I know the
english dict's are the same for the St and the IBM.

First piece of advice: Use a resource construction program (RCP). Building GEM resources by hand is a mind-numbing experience that's no fun for the average human being.

Now, if you were to have many G_TEXT objects (strings for your messages) in your root box, they would be children of the root (since they are _inside_ the box). The G_BOXTEXT button would be another sibling to them. Basically, your object tree would look something like:

```
Root box (G_BOX)
____________/ \_______________
| |
v v
First G_TEXT <--> Next G_TEXT <--:--> G_BOXTEXT
string string button
```

The numeric order doesn't really make a difference.

--R.J.
B-)

P.S. I'm not a guru with the inner mechanics of GEM dialogs; I prefer to stay in the stratosphere of the RCP. However, I'm pretty sure of what I have up there.

129. ST Conversion to a MAC

Newsgroup: comp.sys.atari.st
Date: 1989-02-26 19:18:28 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <890226.13182762.091571@SFA.CP6>
Source record: 249651

I'm not really sure how to contribute to Pat's question concerning using the ST as a Mac since I'n new in navigating on the net.
At any rate, the ST emulates the Mac with blinding speed and few problems. Gadgets by Small (303) 791-6098 @ 40 W. Littleton Blvd., #210-211, Littleton, Colorado 80120, has the best emulator.
I'm running the emulator on a Mega2 and love it. There has been no speed loss or anything. I use FullWrite for all of my writing needs and Excel for other reasons. My terminal software is Red Ryder. Listing these software items should indicate the power of the emulator.
Obviously, one desiring to emulate the Mac should have a monochrome monitor

and preferably a hard drive.
With this type of combination, the ST expands its power considerably.
On yeah, one negative note. The emulator will not recognize Mac disks. Software has to be either converted by a box called the Discovery or by means of telecommunications via null modem cableing or telecommunications to a format recognizable by the ST. It is really a minor hassle.

Source record: 249652

I lost the original message and have not been able to find it so I cannot give the name of the original sender (sorry).

Someone? wrote asking about current formating programs. He asked if the ones that really tweek the disks can damage the drive.

Well I don't think they can permanently, however, if you were one of the lucky people who got a cheap drive in their ST (like me) and you use programs like this you may have to have it aligned often. Do to some copy protection schemes withing about 6 months of purchasing my ST I had to have the drive aligned (it would wine, have trouble loading, wouldn't do disk copys, etc.). Within 3 more months I had to have it aligned again. That was over six months ago, and I haven't had any trouble since. However my computer usually won't do disk copies so I just use ProCopy.

On a similar note... I have found some programs that write to the disk even when it is write protected. Something for us virus watchers to look out for...

Every so often someone posts to the net saying that they cannot find any STs. I would just like to post some info. about ST availability here in Phoenix AZ. I just came from my ST dealer, and he had about ten Mega 4s, five mega 2s, and four or so 1040s. Buy the way he was selling his Mega fours for $1900 (ram prices must be falling!).

I also heard the Tweety Board on demo. It was hooked to 2 speakers so there was no 3-D sound, but it did sound a lot better than the monitor. It was very tempting.

Responding to various messages about viruses...

I agree that knowledge of the *existance* of viruses can be helpful..

I disagree that *specifics* of viruses, either source code, or *descriptions*
of how viruses work, can do anything other than guarantee their spread.

It's true that the information necessary to create a virus is available,
IF you know where to look, and IF you are experienced enough to make use
of that information. Those who are advanced enough to do this *may* be
responsible enough to avoid using that information harmfully... I agree
that there is *no way* to prevent anyone from using information obtained
through independant research like this, in a harmful way..

What I don't think is either helpful, or responsible, is to distill that
information and make it public, so those who might not otherwise be able to
use this *specific* information maliciously can take the work and expand
upon it. (Maybe they'll take their anti-social tendencies and do something
else, like trying to break into Government computers)

I know how an Atom Bomb works.. that knowledge is NOT going to save me if
anyone uses one... similarly, knowing the genetic makeup of the AIDS virus
won't protect anyone..

Even if my friend the print shop owner had known chapter and verse of how
Macintosh viruses work, it STILL wouldn't have prevented his hard drive
from being trashed. The number of people who can make use of specific
information about computer viruses for *good* purposes is probably quite
small, when compared with the potential for abuses.

My point is, the average *user* cannot protect himself with knowledge of
how a virus works.. he needs a *practical application* he can run. In the
Atari ST world, we have several good virus killers, notably the work of
George Woodside in particular. Knowing *how* a virus works is *not* going
to help to use George's program. All it's going to do is to help someone to
write a new virus.

Far from hurting thousands of computer users by surpressing the *specifics*
of viruses, I think they would be FAR MORE at risk if the information is
made public.

>I have seen a program called 220-ST. It is the best VT-100 emulator I've
>seen for the ST. Don't know where to get it, but it's good.

I bought a copy of this before I discovered Uniterm. It's published by
MichTron. It's not bad, really, but I still think Uniterm is better.
220-ST does do pretty complete VT220 emulation. Also has Xmodem and Kermit
file transfer support. The VT220 emulation provides complete mapping of
VT220 function keys, and allows downloading/host-controlled definitions.
They call these macros, I call 'em user definable keys. All you can do is
assign text to them, as opposed to Uniterm, where you can assign strings
of commands. Given that Uniterm is free, and does more, I don't think anyone
would need 220ST. Not to knock the program. It really does everything it
claims to, very well, but Uniterm also works well - why pay for something you
can get for free, eh?

136. UUencode (was Re: FTP)

Newsgroup: comp.sys.atari.st
Date: 1989-02-27 00:41:27 UTC
From: hyc@math.lsa.umich.edu
Message-ID: <581@stag.math.lsa.umich.edu>
Source record: 249658

Standard Unix uuencode/uudecode does not know anything about the include directives. That's part of your problem. If you concatenate the multi-part encodings by hand and still get errors, one can only presume you did something wrong - put them in the wrong order, left in a line you should have deleted, or deleted a line you should have left intact. A multi-part encoded file begins at the
begin blahhh
and ends at the
include blah2

You should delete all the "include" lines when concatenating by hand, as well as all but the first "begin" line. Usually every encoded line begins with 'M' - when you finish, there should be one "begin," one "end," and a lot of lines starting with 'M', but nothing else. (There may be a line beginning with a space, immediately preceding the end line. This is generated by a [harmless] off-by-one error in the test conditions of standard uuencode. Since it only results in 3 extra bytes, I guess no one has ever bothered to fix it.)

The easier thing to do is to grab the sources for the ST uuencode/uudecode programs and install the programs on your Unix machine. They run fine, and then you never have to worry about those includes ever again.

The host named him1.cc.umich.edu is getting its name changed. The address will remain the same, though, so you can still FTP to 35.1.1.43 to get files. In case you don't know what's there, we've been archiving articles from comp.os.minix (Actually the Internet Info-Minix version) online, as well as all the goodies being posted on comp.{binaries,sources,sys}atari.st. [There's other stuff as well, but these two are what I'm intimately involved with...]

FTP to 35.1.1.43, login anonymous, any password. Change Directory to "PC7:" for the Atari ST archives, "MINX:" for the Info-Minix stuff.

Don't know what the new host name will be, but I'll keep you all posted... In the meantime, the address should always work.

Are there any public domain Hard Drive formatting and partioning
programs out there that allow for more then 4 partitions? Does
anyone know if ICD sells just their software?
Thanks!

p.s. could you reply to me direct as I'm very anxious for an answer!

Before I try out my 3 best guesses, I thought I'd ask for advice on this one:
I'd like to have a particular program plaster a big dialog box on the screen.
After the dialog is over, I'd like to get the screen redrawn properly (natch')
The problem is: suppose I've plastered that dialog over someone else's window.
The prime example is the control panel: if it's displayed when I need that
dialog, I'd like to cover it up, but I'd also like to be able to restore it
at the end of the dialog. The three hottest ideas I had were:
1) When I redraw my own screen, watch the rectangle list for areas I don't
own. Use wind_find to see who does own those areas (I presume the mouse
doesn't actually have to be there for the wind_find to work) and send redraw
messages.
2) Open another window to contain the dialog and close it when the dialog is
done. This should cause everyone (me included) to get redraw messages, but
I'm trying to limit the number of windows if I can.
3) Make a buffer. Save the area under the dialog, and restore it at the end
of the dialog. How dull; how memory-hungry.

Any informed suggestions? Other ways? Warnings?
Steve J.

As the author of ARCGSH I'd like to state that I plan to
integrate a mechanism for calling ZOO from ARCGSH.
Unfortunately I haven't much time currently to do so but some
day it *will* come.

I just received the shar/unshar package in the sources group.
If it works reliably I will also support it with ARCGSH. (Ok,
the name "ARCGSH" may be a little bit confusing after those
extensions.)

142. BMS100 /w SCSI drive

Newsgroup: comp.sys.atari.st
Date: 1989-02-27 12:45:36 UTC
From: L12@DHDURZ1.BITNET
Message-ID: <8902271245.AA27866@ucbvax.Berkeley.EDU>
Source record: 249664

Hi ppl,
here's some problem report from a pretty european layman:

After weeks of decision processes I purchased the well-known
atari ST host adaptor from Berkeley Microsystems, "BS100".

This is told to interface the ST-DMA port to a SCSI bus, /w reduced
CCS, though.

Tryin' it with a ST277N drive the installation routine does not
recognize it as regular DMA device (all numbers grey!!!). Furthermore
the BMSINIT.PRG does not seem to support a drive with 64 MB. So:
What can I do? Hints greatfulliest appreciated - thanxalott!

The operating system of the QL is QDOS, not Tripos.

To return to the article: I think porting software from a QL to an Amiga (or
vice versa) is about as difficult as porting software from UNIX to a QL :
Not to simple. The problem is that QDOS is a quite odd operating system; it
has calls which can do the job but with different calls then you should expect.
e.g. a stty() call on a window is not existent; one should use another call to
read in "raw" and "cooked" mode (no cbreak; signals doesn't exist on a QL).
Another major problem is the lack of any environment variables on the QL.

Most virus detecting programs work by intercepting writes to the
hard disk and by checksumming programs before running them. A small
change in a virus is not going to make it invisible to this type of
checking.

I am also a fond user of C-Lab Notator. Does everything indicated in the base note, and is amazingly bug-free. My only real complaint with it is that it has a really confused (and combined) notion of triplets and dotted notes. Oh, you can get it to do what you want, but it takes a little getting used to. All in all though, a great program.

147. I-APL

Newsgroup: comp.sys.atari.st
Date: 1989-02-27 15:42:19 UTC
From: chaz_heritage.WGC1RX@XEROX.COM
Message-ID: <890227-074809-3739@Xerox>
Source record: 249669

I am on the mailing list of the International APL Project. This is a dedicated group of APL enthusiasts who are engaged in the historic endeavour to devise a variant of APL (A Programming Language) which will work on a large number of microcomputers and which will standardise itself worldwide.

APL is a difficult-looking language, consisting, at first sight, almost entirely of curious heiroglyphics. However, it is immensely powerful. The Sharp-APL manual gives examples of the same program written in FORTRAN, BASIC and APL. Both of the 'conventional' languages require a dozen or so lines of program; APL achieves the same result with half a dozen characters. An array-oriented language, it has great potential for mass information handling. It also seems possible that APL would be the most suitable route for implementation of arcana such as the RSA cipher.

The Atari ST, with its facility to import screen fonts, is an ideal platform for APL. The only 'extra' required would be a keyboard's worth of stickies to show the 'heiroglyphic' function of each key. However, I note from the latest newsletter of the I-APL Project that I-APL has not yet been ported to the ST. I quote:

>Porting Help is Badly Needed

Such abilities are like gold dust (at least if they are combined with the time and the sort of altruism needed to work on this project) and if anyone knows where they are to be found we would be delighted to hear. A port...for the Atari ST... could bring the author kudos, a warm feeling and the thanks of thousands. We will pay out of pocket expenses. If you know of a potential porter and think you could keep them encouraged to a successful conclusion - ring me up. I have a stack of ready prepared porters' kits.<

The I-APL Project intends to release versions of I-APL as cheaply as possible - the software costs no more than its media, and the manuals cost less than would photocopies of the same documents . Effectively they place their work into the public domain, with the express intention that it should be available to as many people as possible.

Such internationalist altruism is deeply unfashionable in today's world. The release of a new language for a particular machine is usually the preserve of profit-conscious software houses, who protect their profits with litigation, spoilers, dongles and the occasional virus. The I-APL Project is different. I cannot help them - I am only a poor hardware type, with my knuckles and soldering iron dragging on the ground. However, I know that out there are people with the most arcane and esoteric software skills, one at least of whom must be looking for a project worthy of their talent, outwith the common run of shoot-em-up games and yet more C-compiler

modifications.

One of the people reading this has the power to make the Atari ST one of the standard platforms for I-APL. The I-APL Project estimate that >it would take a competent programmer, who knows both the operating system and machine code thoroughly, between a week and a fortnight to do a good port.<

If anybody with these abilities feels that they can offer any assistance to the I-APL Project I would ask them to contact me. I will immediately put them in touch with the I-APL Project, and do whatever I can to facilitate their work.

Regards,

Chaz

Message-ID: <3838@druwy.ATT.COM>
Source record: 249671

in article <937@cernvax.UUCP>, jmg@cernvax.UUCP (jmg) says:
> My only Spectre problem is that I cannot get any answer from the Small
> family (are you there, David?). Having had my messages to well.uucp
> bounce back to me and my snail mail producing no response I am hoping
> that this broadcast gets some response.
Dave is on two systems on the net. Neither one seems to be a
very reliable method of contacting him, at least not yet. You can send
him mail at:
dsmall@well.UUCP
{big sytem}!boulder.Colorado.EDU!tcr!gadgets!dsmall

If Gadgets received your snail mail they should have responded.
Sometimes they are a little slow, mostly due to the volume of mail they
receive.
I don't know if they have done anything to handle foreign orders
yet. They may be waiting till a decision on foreign distribution is
made before answering foreign mail.

The absolute best way to contact Dave is via GEnie, Gadgets by
Small has their own "Roundtable" (GEnie discussion group). Dave
normally gets on GEnie at least once a day to answer messages. Gadgets
also has a section in the "Atari Vendor Forum" on CompuServe. Dave
normally gets on there every day or two to answer messages.

> Progress on the version with sound?
Version 1.9 which has limited sound support is just entering
beta test. The Mac normally samples sounds at 22 khz, the Spectre is
currently limited to 11 khz. The 68K in the ST is just too slow to
really handle 22 khz and doing anything else (like move the mouse). The
Mac uses DMA (part of the screen data fetch) to move one byte of sound
data from the sound buffer to the hardware every time a scan line is
displayed. Dave is looking into ways of supporting 22 khz playback on
the ST, possibly for version 2.0.

> Read real Mac disks without Translator-1?
Gadgets received the first prototype GCR circuit boards a couple
of months ago and Dave has started working on the code for them. They
haven't announced a release date yet. My guess would be late spring or
early summer, of course I could be off by 6 months either way.

If you try the MicroSoft mouse you you would find the $20
difference to be minimal. The feel of the MicroSoft mouse
is just clearly superior to other mice in that price range!

And, by the way, I do not work for MicroSoft or am in any way
related to them - just an impressed consumer. I am, of course,
referring to the MicroSoft II mouse (the rounded white one).

saj@chinet.chi.il.us (Stephen Jacobs) writes about dialog trashing. Here is my code for dialogs. You will get a redraw event upon closing the dialog if things are set up right. No muss no fuss. This code works so enjoy! (Its actually part of the user interface from UltraScript).

Here is code to pop up the dialog.

```
wind_update(BEG_UPDATE);
form_center(who,diptr);
form_dial(0,1,1,1,1,dibox);
form_dial(1,1,1,1,1,dibox);
objc_draw(who,ROOT,MAX_DEPTH,dibox);
what = form_do(who,0);
form_dial(2,1,1,1,1,dibox);
form_dial(3,1,1,1,1,dibox);
wind_update(END_UPDATE);
(who+1)->ob_state = NORMAL; /* Select off */
```

And here is my code to redraw here:

```
do_redraw(msg)
int msg[];
{
int whandle;
GRECT t1,t2;
int clip[4];
lineaa(); /* Mouse off */
whandle = msg[3];
t2.g_x = msg[4];
t2.g_y = msg[5];
t2.g_w = msg[6];
t2.g_h = msg[7];
wind_update(BEG_UPDATE);

wind_get(whandle,WF_FIRSTXYWH,&t1.g_x,&t1.g_y,&t1.g_w,&t1.g_h);
while(t1.g_w && t1.g_h) {
if(rc_intersect(&t2,&t1)) {
clip[0] = t1.g_x;
clip[1] = t1.g_y;
clip[2] = t1.g_x + t1.g_w - 1;
clip[3] = t1.g_y + t1.g_h - 1;
vs_clip(vdihandle,1,clip);
/* Redraw your stuff here */
}
wind_get(whandle,WF_NEXTXYWH,&t1.g_x,&t1.g_y,&t1.g_w,&t1.g_h);
}
```

```
wind_update(END_UPDATE);
linea9(); /* Mouse on. I would use graf_mouse BUT that is another story */
}
```

Recently, I heard that someone is coming out with a removable hard disk drive for Atari ST. These drives are supposed to have the same access time as the fixed hard disk drives and they are very cheap (around $300 for the drive and $10 for the disk).

Is this a fact or just plain rumor. Please send me e-mail if you know more about this. I will post a summary of all responses.

Thanks in advance,

Prabhat Sahay

I picked up the metafont posting today... but haven't a
clue as to how to use it... are there docs somewhere out there?

Also, FTP'd ssyx.ucsc.edu volume2/fontedit/part01-02
In the dox, it says something about a "second arc'd file"
containing about 6 fonts.. including a chinese, mac and others...

Any one know where i can get that specified file?

Your help is apprecitated....

An all encompassing thanks to those who helped me with
the Dumas vs. UNIX uudecode confusion...

In article <15139@cup.portal.com> Bob_BobR_Retelle@cup.portal.com writes:
>
>I disagree that *specifics* of viruses, either source code, or *descriptions*
>of how viruses work, can do anything other than guarantee their spread.

[I stopped cross-posting this, since this discussion is ST-specific.]

Um, I wrote a boot-virus-detecting desk accessory based on information posted here. The *specifics* of the virus (that it lived in boot sectors of floppies) were necessary for me to write the detection program and to write documentation detailing how to use the detection program and how to kill these boot viruses.

Now say instead someone had posted, "I've seen this virus but I won't tell you how it works. You'll just have to quiver in your boots. But I'll tell Programmer X how it works and he'll provide a cure." Well, that's responsible, right? Except I'm not Programmer X, I don't know Programmer X, and I have no way to prove to the poster that I also deserve the information. So I have to wait 2 weeks for Programmer X to write some virus detection program which may or may not work, or could be a Trojan Horse? And what if I don't like Programmer X's program because it's hard to use, ugly, and wastes disk space? Why, I'm out of luck.

Instead, by posting enough specifics for anyone to write a detection program, we get several detection programs in different styles which can be compared to each other. This is the (I hesitate to say it) free market of public domain software, eh?

I would like to thank George Woodside for his nice anti-viral programs. But I actually don't use them -- I use my virus-detecting desk accessory, which is only a couple of kbytes and can always be called up at a moment's notice. I don't think that virus source code should be posted to this group. But details should be, because without them we can't get anti-viral programs written, because you never know who to trust with the information.

Finally, I'd like to note with some amusement that the "details" about many viruses can easily be gleaned from the instructions on what their effects are and how to kill them. So there is no way to restrict this information anyway. In the case of the boot virus, the first mention of "this virus infects your machine if you boot from an infected floppy" sent me to my BIOS listing, where I found the bootblock checksum routine and wrote my detection .acc in under an hour.

[This .acc is on CI$ and (I think) in the PC7 archives, I think. It's ugly but it's small and works.]

158. Broken ST revisited

Newsgroup: comp.sys.atari.st
Date: 1989-02-28 03:26:35 UTC
From: mkentley@wpi.wpi.edu
Message-ID: <1086@wpi.wpi.edu>
Source record: 249680

Thanks to everyone who replied to my message about my Broken ST....
The problem did turn out to be a bad solder joint on my 1meg upgrade, so if anyone else is having problems with their system giving 2 and 4 bombs, then rebooting forever, and you have the 1meg upgrade with piggybacked chips, check the solder joints first..

Apparently, already flaky solder joints come undone when the machine has been running for a long time and gets very hot. All it takes is to go over your solder connections with a magnifying glass and fix the ones that look really cheesy.

Thanks again for the help

in Byte a few months ago (the NeXT review issue), there was a blurb about
a (supposedly 100%) ST225-compatible 20 MB removable floppy drive which
is supposed to be priced to directly compete with the Seagate hard drive.
the article sez the disks would (be made by Kodak?) cost about $8 each.
if it is in fact plug-compatible with the hard drive, you could theoretically
just open up your SH204 and drop this puppy in. how you get the disks in
and out after you close the cover is another matter *8^). finding the disks
could also provide hours of fun...

-bill
rosenkra@hall.cray.com

(some SH204's use ST225's, right?)

160. Good ST software and hardware for sale

Newsgroup: comp.sys.atari.st
Date: 1989-02-28 08:44:00 UTC
From: mdoyle@oracle.uucp
Message-ID: <719@oracle.oracle.com>
Source record: 249682

All of the following software includes the original disks, original
documentation, and, usually, the original box!

Hardware:
Atari SF 314 Double Sided Disk Drive $145

Productivity Software:
Laser C V1.0 (V 2.0 can be obtained for $10, and
Laser DB for $39.95, with upgrade card.) $99
Thunder (good spelling checker) $25
MT C-Shell V1.0 (multitasking UNIX-like Shell) $39
Logikron Clock Cartridge (automatically get
correct time on bootups) $23

Game Software:
Mindshadow (You wake up on a deserted island
with no memory...) $18
Hacker (Break into computer & save the world) $15
Time Bandit (16 arcade games & 3 graphic/text
adventures in one) $20
Ultima 2 (Second in the famous series) $18
Sundog (From the makers of Dungeon Master) $18

Magazines:
STart Summer 86-Winter 87 + 1st 2 special issues,
all with disks (lots of good software),
11 issues $35
ST Applications - complete set Sept 85-Sept 88,
37 issues (This was the best ST magazine.
Many good reviews, programming columns, and
general reference articles.) $45

All prices do not include postage (should it be necessary). For each item,
first offer at the price asked takes it. All these prices are negotiable,
however; make me an offer if you think the posted price is too high.

Source record: 249683

From article <958@blake.acs.washington.edu>, by a360ad@blake.acs.washington.edu (Gnurr):
> About a month ago, a few people were wondering if there were
> any good MUSIC sequencing programs available for the ST.
> While a quality sequencer is of great value to many musicians,
> a convincing and workable NOTATING system is the hunt of many.
[stuff praising Notator deleted]
> Those interested in more information about NOTATOR, MIDI-STUDIO,
> HYBRID-ARTS EZ-Score and DR.T's and MUSIC STUDIO may contact me..
> .. i've tried them all

C'mon, you can't be serious. Nothing I've seen on the Atari
comes close to decent music notating. And I mean
Steingerg Masterscore and C-lab Notator included.

How come these star-programmers can spend, say, two years hacking
away and never spending $20 for an elementary textbook
on the basic rules for music notation.

They make the most hideous errors. The psychology of this
is completely beyond me.

Yours puzzledly,

Victor.

From: leo@philmds.UUCP
Message-ID: <968@philmds.UUCP>
Source record: 249685

In article <679@mks.UUCP> egisin@mks.UUCP (Eric Gisin) writes:
[]
|The One True "lc" predates V7; it was invented at
|the University of Waterloo under V6 (maybe earlier).
|The 4BSD version has been posted to comp.sources.unix.
|
|On Xenix, lc is a link to ls, and is effectively an alias for "ls -C".
|This is probably a Xenixism, based on a Berkeleyism.

As far as I know, -C is not to discern between sorted down or sorted
across, but to force multiple column output. 'ls' and 'ls -C' give
exactly the same result (when connected to a terminal) on my system
(Ultrix 2.0, which is a Berkeleyism 8-). Remember that 'ls' is a very
old Unix program; it tries to be smart: when standard output is a
terminal you get automagically multiple columns (and sorted down), when
not the filenames each appear on one line; try f.i. 'ls|more'. Nowadays
that would be considered a kludge, but since 'ls' is that old, changing
it could perhaps break other programs (notably shell scripts).
So if you want multiple columns through the pipe, do it ala 'ls -C|more'.
If your experience with -C is different, your system is certainly
different from BSD.

|Why would anyone want their files sorted down instead of across?

That's not so unreasonable; telephone books are also organized that way.
In fact it is much easier scanning a vertical list than a horizontal one
(of course your opinion may differ ...). The only time I don't like this
is when a column is longer than the screen (but why shouldn't scrolling be
sidewards instead of downwards ...).

Leo.

In general, I agree with the philosophy of publicising the UNIX password encryption algorithm: if it can't be made secure enough to resist a determined attack, publicise it so nobody will have a false sense of security. Likewise the philosophy of having a 'crash' command in the incompatible time sharing system: if there's no challenge in causing mischief, why bother. On the other hand, if George Woodside has to promise absolutely no disclosure in order to get samples of viruses, that's no problem. Whatever it takes to make people feel comfortable. As an aside: judging by recent discussion in news.admin, 90+% of UNIX systems are vulnerable to the mkdir trick. Practically nobody uses it because it's

no fun.

Perhaps someone who knows more about this will comment.

I have used "lc" since the early 70's,
When was System V introduced?

169. Problems with new DCFORMAT.

Newsgroup: comp.sys.atari.st
Date: 1989-02-28 17:17:00 UTC
From: TOXICO@HNYKUN52.BITNET
Message-ID: <8902281839.AA22816@ucbvax.Berkeley.EDU>
Source record: 249691

Distribution-File:
"info-atari16@score.stanford.edu"

I used to format my disks with DCFORMAT 2 at the maximum size of 10 sectors, 82 tracks without any problems. A few weeks ago I got the new DCFRMT30 from the ssyx archive server. I tried this on a box of brand new SONY DS/DD disks. I decided to use the new VERIFY option but otherwise chose the same options I was used to (10 sectors, 82 tracks fast (skewed) format. To my surprise three out of seven disks gave an "ERROR during FORMAT". I reformatted this disks at smaller sizes (one at 10 sectors, 80 tracks; the other two at 9 sectors, 80 tracks). I did keep the verify option on, and did not leave the program before all disks had been formatted and verified. DCFMT30 did not complain about any errors when the options were chosen as shown.

So far so good. I did not really like the idea that the disks could not be formatted at maximum size, especially because I had always used that size before. HOWEVER, THE SMALLER FORMATTED DISKS ARE NOT USABLE. The ST refuses to write to those disks. The desktop shows an empty disk, and that's it.

I do not known whether the smaller disk formats will work, when you use them immediately. I do know that they will not work when you first try to format at 10/82 and thereafter, without leaving the program, format them with less tracks (sectors?). Disks formatted even later at 10/82 (still without leaving the program) were allright.

Two questions:
1) Is this really a bug in DCFRMT30, or am I doing something wrong.
2) What exactly does the verify option do, are these disks really bad?

P.S. I reformatted one of the not writable disks with the old DCFORMAT 2.0. No problem!

>The One True "lc" predates V7; it was invented at
>the University of Waterloo under V6 (maybe earlier).
>The 4BSD version has been posted to comp.sources.unix.

I think that "lc" pre-dates V6, even. I believe it was written
in the early 70s, shortly after the Math Faculty acquired a machine
with a GCOS operation system. It was out the the frustration of having
to deal with a couple of miserable "cata" and "catl" commands that
"lc" was born, and was one of the first of a new breed of system
commands installed on that system. The command was written in "B",
(a pre-cursor to "C"). When the Math Faculty acquired a UNIX system,
the "B" code was quickly translated to "C".

Today, many users on Honeywell and Honeywell-Bull machines running GCOS
operating system use the "lc" command, along with other software developed
and written at Waterloo. Those who must use that hardware, but who do
not have the benefit of this software, suffer under undue hardship.

Ah, finding Ataris can be a difficult experience, however, I have had
a pleasant surprise recently. Our campus is packed wall to wall with Macs, PCs
and PSIIs. A rather sickening sight to Atarians. However, this past week I
discovered a room at the health center. It appears that the health center uses
STs. In a full count, it was about a dozen 1040s, 3 or 4 megas, a laser
printer, and an image scanner. It was a nice sight.

This is the very preliminary report of FSP 2.0. It showed up in
the mail today. I found a bug within 5 minutes but it is in an error
path that you shouldn't go down if you install it right.

As for the real stuff, I managed to get it to write a page of PostScript
to a disk, carry the disk to our UNIX system with the LaserWriter and have
it actually produce output. This was just their sample page with a couple
of quick changes by me but it worked and looks good. The bad news is that
there are none of the "required" comments in the generated PostScript.

I will continue to play with this guy and hopefully will have a more
detailed report available in a week or so. For anyone who doesn't
remember I am the poor sucker that tried to get Publishing Partner to work
- by that I mean generate the right stuff in PostScript and have managed
to break every release they were willing to send me.

I asked how to pass redraw messages to applications whose windows I had scribbled in. Hedley Rainnie posted a piece of code that handled dialog closing properly, and Greg Anderson explained it. In summary, GEM doesn't know about the scribbling, but the correct form_dial() call tells GEM to send redraw messages. I looked at my code, and the problem was that I ended the dialog handler with form_dial(FMD_FINISH, cx, cy, cw, ch, 0, 0, 0, 0);. Apparently this only sends a redraw to a null rectangle rather than the one defined by cx cy cw ch. The fix is then apparent. It appears from the documentation I have that DR defined this call as taking only one rectangle as an argument, but wrote the code to require two. As a result, the documentation available is not quite clear enough to penetrate the cotton in my head. (By the way, I use MWC).

183. nullfilling

Newsgroup: comp.sys.atari.st
Date: 1989-03-01 05:20:58 UTC
From: U46050@UICVM.BITNET
Message-ID: <8903010551.AA25974@ucbvax.Berkeley.EDU>
Source record: 249705

Hello all: I was just thinking about the whole nullfilling mess. Yeah, I know... not this again... Wait, wait, this might actually make sense:

To Atari Corp: What do you think of the idea of allowing the program that is run to decide if it wants the memory blanked? I know that the code that you are now using is really fast but there is still a noticible real time delay when running programs (smaller ones especially) on a machine with a few meg of memory.

Here's the proposal: Atari, write 4 instructions worth of code into those new, amazing, almost-as-good-as-sliced bread v.1.4 ROMS that check the last 4 bytes of the program that was just loaded (I'm sure that 4 instructions are able to fit into that 192K or ROM). If those last 4 bytes are some magic value, say 628318530 (2*pi, yes, I know, really original...) then the memory clearing code is just ignored. This would make all present software automatically compatible and all future software better written (people will think before writting code that assumes what it shouldn't (blank mem) (yes, I know, K&R says this and K&R says that... hooey! I don't like C anyway). Best of all, this is completely optional. The software developer who wants the extra speed can get it and he/she who doesn't does not have to do anything... just as if it were still 1985.

Atari, think about it and even better, do it.
Everybody else, what do you think? Is this a brilliant idea or (embarassment:) has this been suggested before or is it for some reason stupid and it will never work?

either way, let me know... ...John Zafiris

184. Re: Right of reply, virus- public, private- a thin line

Newsgroup: comp.sys.atari.st

From: Bob_BobR_Retelle@cup.portal.com
Message-ID: <15225@cup.portal.com>
Source record: 249706

Greg Lindahl writes that he was able to write a virus detecting ACCessory from a description of a virus...

That's great, and Greg's ACCessory may be able to help a lot of others to check out their disks... but... Greg and others here are in the minority when considered against the larger body of ST *users* to whom a description of a virus would be largely "Greek". To them, the information would be practically worthless, other than to alert them that such things are possible..

My concern remains that there are VERY few people who could use this kind of information constructively... and all too many (>0 is too many) people who could infer how to create or mutate a virus from it.

Here's another question... how are we going to protect all the thousands of ST users who don't have access to modems, and who can't obtain a virus "killer of any kind..?

Is disseminating virus information going to help them..?

BobR

(I hope everyone realizes that I'm playing devil's advocate here... a LITTLE)

The problem is that with source code, any jerk with MPW who can type can
release a mutated version of the virus in an attempt to avoid the current
detection programs (futile, we will catch it in a few weeks, but a pain).

Whereas to disassemble and modify a virus without the source code takes a
fair amount of knowledge and skill.

From: grigw@datlog.co.uk
Message-ID: <1785@dlvax2.datlog.co.uk>
Source record: 249709

I would like to upgrade my 520ST (new model) to 1Mb RAM. My ST contains
a bank of 4 256kx4bit RAM chips (NEC part number D424256C-10) with space
for 4 more. It looks as if the decoupling capacitors are already there.
Does anyone know how to do the upgrade? Is it just a case of
putting in the new chips ? (In sockets of course). Please mail replies
and I'll summarise. Thanks for your help.

Regards,

Warwick

190. Virus 101 - Chapter 1

Newsgroup: comp.sys.atari.st
Date: 1989-03-01 14:39:58 UTC
From: woodside@ttidca.TTI.COM
Message-ID: <3970@ttidca.TTI.COM>
Source record: 249712
Cross-posted to: comp.sys.atari.st,comp.sys.apple,comp.sys.mac,comp.sys.ibm.pc

Preface: The program VKILLER is specific to the ATARI ST. My apologies for not making this clear in the previous posting, which went to several newsgroups. I have recieved far too many requests for the program from users of other systems to reply to each one individually, and the mailer has bounced some of the replies I tried to send. If you have an Atari, VKILLER was posted here a few weeks ago, and is available in the archives, on GEnie, Compuserve, and from most public domain disk distributors and User Group libraries. The current version is 2.01.

Initial postings will cover virus fundamentals, as they apply to the area of the Atari ST and, similarly, to MS-DOS systems. The file systems of the two machines are nearly identical. These general information articles will be cross-posted to the newsgroups in which this topic is now active. Future postings will be made only to the Atari newsgroup, since they will deal with viruses (the plural, according to Webster's, is viruses) known to exist in the ST world. They would automatically be different than an IBM virus, since they are in the 68000 instruction set, or from a Mac or Amiga virus, since the file systems differ. Since all the viruses I have located are the "BOOT SECTOR" type (far and away the most common), that's what I will dwell upon. If and when the proposed newsgroup comp.virus becomes active, it will be added to the list for all postings.

Your generic disclaimer: I just an old-school computer hacker, with 20 years in the software business. I built my first IMSAI many years ago, and have had several different computers. That qualifies me to have spent a lot of time on computers, but nothing further. I may be wrong about some things, may have a different opinion than you or anybody else, or most anything else you'd care to have disclaimed. What I think is my own opinion, and in no way represents the opinion or position of my employer or anyone else. I've written several articles for magazines as well as software related to virus detection and killing, but I have been known to be wrong (so they tell me :^)).

While posting any kind of information about viruses may trigger someone to attempt creating one, I believe that the benefit of the knowledge to potential victims outweighs that risk. I don't believe that you can stop someone (who wishes to) from creating a virus by withholding information - it is already available from many sources. Since not all viruses act the same, or attempt to attack in the same manner, it may help potential (or current) victims to learn about the symptoms of the viruses known to exist, and how to protect themselves.

While the concept of viruses can be complex, I'll try to keep things at a level that should be understandable by most anyone past the casual user genre. However, since I've been at this sort of thing for some time, what I consider basic knowledge may not be familiar to everyone. Advance apologies are offered here for any invalid assumptions, typos, smart alec remarks, grammatic errors, or whatever offends you.

Some basic terms, as they have come to be used in this area:

A VIRUS is any program which spreads itself secretly. It may be destructive, a prank, or even intended to be helpful, but it spreads.

A TROJAN HORSE is a program which executes one function secretly while appearing to be accomplishing some other task, or appearing to be some other program entirely. One task a Trojan Horse may accomplish is to install a virus, which would then spread itself.

A WORM is a program or function which imbeds itself inside another program, be it an application, part of a system, a library or whatever. It may or may not spread itself by some means, and may or may not have destructive intents.

Now, to the basics of a disk (specifically floppies, but true of most hard disks as well):

A DIRECTORY is a list of files and sub-directories. There is one primary directory (called the root directory) on a disk. It contains the entries for files, and other directories (called sub-directories, or folders on the Atari). Sub-directories (folders) may contain entries of other sub-directories, files, or both. Every file has one entry in the disk directory (or in some sub-directory). That entry contains, among other things, the file name, date and time of creation, length, and the address of the first entry in the File Allocation Table (FAT) for the file.

A FAT is a File Allocation Table. It is a road map of how the operating system will locate data on a disk. Essentially, it is a series of pointers. The directory entry of a file points to the first FAT entry of that file. That entry points to the next, and so on, until the last entry, which contains a special value indicating end of file. There are two copies of the FAT on the disk, since it is absolutely critical. Lose the FAT, and the data on the disk becomes un-accessable.

A BOOT SECTOR is the first sector on a floppy disk. With the Atari (and MS-DOS) system, it contains configuration information about the disk. That information includes how many tracks are on the disk, how many sectors per track, how many sides on the disk, how big the FATs and directories are, where the data begins, etc. On the MS-DOS systems, the boot sector contains the ID of the operating system under which it was formatted. On the Atari, that value is not used, but replaced (in part) by a number. That number should be different on every disk, and is used as part of the mechanism by which disk changes

are detected. The boot sector may or may not contain executable code. If it does contain executable code, it is normally executed only at system powerup or system reset time.

On all such disks, the boot sector is number 0, the first sector on the first side of the first track. On a standard format Atari disk, the next five sectors are the first copy of the FAT, the next five sectors are the second copy of the FAT, the next seven sectors are the root directory, and the remainder of the disk is available for data.

Now, on with the show:

Floppy disks are changed on a regular basis while the computer is being used. More so on systems with no hard disks, but periodically on most all systems. This event, referred to as a "Media Change", is detected by the computer's disk drive. The disk door is opened, the status of the write protection changes as one disk is removed and another is inserted, etc. When that happens, the operating system must recognize that the disk has been changed before attempting to read or write to the new disk. The operating system reads the disk's boot sector to learn about the newly inserted disk. That instant, when the operating system checks the new disk, is when nearly all the boot sector viruses spread. We'll get to that in the next chapter, but first, a more primary question:

How did the virus get in there?

When a computer is booted up from a power off state, or reset (in most cases), it starts executing code from internal ROMs. Those ROMs set up primary vectors, minimal configuration information, and perform some fundamental tests. Then they start moving into uncharted waters. They have to find out what devices are attached, and get them into operating status. They also have to provide a means of expanding their own capabilities to support new devices, functions, and whatever else which may not have existed when the ROMs were created. One of the means by which this is accomplished is by checking various addresses for special codes, magic numbers, or any kind of response to a read or write. Another function which may be enabled is checking the boot sector on an inserted floppy disk for executable status. If that boot sector has executable status, the code contained in the boot sector is executed. That code may cause other portions of the disk to be loaded and executed, set variables or vectors, or nearly anything imaginable. That includes infecting the system with a virus, if that's what the boot sector code contains. Executable status may be via a special flag value in a reserved address, but it is normally determined by adding up the value of all the data bytes in the boot sector. If the total derived (called a checksum) is a specific value (a "magic" number), then the boot sector is deemed executable. The code is usually executed at that time. The code is not normally garanteed to be loaded at any specific address in memory, so it must be "position independant", or capable of executing no matter where it exists in memory.

The boot sector is of limited size, normally 512 bytes. While that is enough for a small program, it may not be enough for whatever task it is designed to accomplish. So, part of what the code in the boot sector accomplishes must be to load the rest of the code it needs to get the job done. This may be a normal data file, or hard coded to some other part of the disk.

If the code from the boot sector is designed only to accomplish some task, it will normally take the steps to do so, then return to the operating system. This may be setting the screen resolution or colors, issuing an initialization command to some device, or setting up some option or feature. If the code is designed to remain available after the initial execution (such as part of a device driver), it must inform the operating system that it wishes to remain resident. The operating system then alters the amount of RAM available to protect the space occupied by the loaded code, so that subsequent programs do not tamper with the loaded routine. Such a routine is referred to as a "Terminate and Stay Resident" routine, or a TSR. Viruses must be TSR type programs. They have to remain in the system, and active, to be able to accomplish their spread, and eventually, their true goal. If the boot sector program was designed to attack immediately, it may accomplish its destruction, but it would never get the opportunity to spread, and the disk which caused the attack would be easily identifiable.

Most viruses accomplish system infection by taking over a "vector". A vector is a specific address in system memory which contains the address of a routine or function. When an interrupt (such as pressing a key, the clock ticking, or so on) occurs, processing is suspended, and the system loads the address in some vector associated with that event. It executes the routine at the address which was stored in the vector, then resumes whatever it was up to when the interrupt occurred. Other vectors are not associated with interrupts, but with specific functions, such as display a character on the screen, read a sector from the disk, write to the printer, and so on.

To take over a vector, the steps are fairly simple. A RAMdisk, for example, will usually take over a disk read/write vector. When it installs itself, it removes the current address from the vector assigned to the disk read/write function. It saves that address in it's own code, and places the address of it's own code in the vector. When a disk read/write call is made by the operating system, the operating system loads the address found in the proper vector, and starts executing the code found at that address. That address now points to the executable code of the RAMdisk. The first thing the RAMdisk does is check the function call's parameters to see if the read/write is for the RAMdisk. If it is, the RAMdisk accomplishes the read or write, and returns to the operating system. If the read/write is for some other disk drive, the RAMdisk code passes the call on to the address it removed from the vector, allowing the assigned device to accomplish the task.

There may be more than one alteratiion of the vector. Each new routine which is installed will save the old vector, and insert itself. That means that the routine installed last will get the first access to any call which uses that vector. If it does not want the call, it passes the call on to the address it found in the vector, and so on. The significance of this sequencing is that a boot sector virus, if present, will be one of the first "vector snatchers" to get installed. Conversely, it will be one of the last routines in the sequence to get executed when a vector is accessed.

If the vector in question happens to be for floppy disk I/O, the virus will be one of the last vectors before the real physical read/write routine. So, if a program designed to detect a virus's floppy disk I/O calls is executed as part of a startup procedure, it can easily be fooled. The detect program will see only normal system I/O calls passing through the vector. The virus resides in the vector list after the anti-virus program, so the anti-virus will never see any activity generated by the virus. The anti-virus thinks that things are progressing well, while, in reality, the virus is either spreading or doing damage behind the anti-virus's back.

If the anti-virus gets installed first (say, by being in a boot sector itself), it has a better chance of offering protection, but not an absolute one. Some viruses check things like ROM version numbers, and know the absolute addresses in the ROMs of the functions they want. By using those addresses, they can bypass subsequent links in the vector list, and still do their dirty work. They can also refuse to install themselves if the addresses or version numbers do not correspond to the environment they want.

End of Chapter 1.

Source record: 249714

Our company has had a rash of mouse failures. The situation was puzzling because not one home user had a similar failure and there are more mice (mouses) off site than on site.

We believe we know the problem. There are load resistors used in conjunction with the phototransistors. They typically have values of 600-800 ohms. With extended hours of operation (7-8 hours per day computers are on at work, typically <1 hour at home) there appears to be some deterioration in the load capacity that is followed by transistor drift.

If all resistors are changed to 1K ohm, voila the problems go away (except that labour costs make it more expensive to replace the resistors than to buy new mice).

Is Atari aware of this problem and has it been addressed properly? Or are there bound-to-fail mice out there in production lines?

Correct (sort of) but misleading. Virus detecting inits such as Vaccine work by intercepting certain resource manager calls. Unfortunately, they can get in the way. Checksumming programs is fine, but it involves adding checksums to each application or storing them in a central file; each is vulnerable to viral action. Viruses can be reprogrammed to avoid these.

Additionally, when you talk about detect and REPAIR programs, small changes in viruses will make them invisible and/or unrepairable until the program is updated. This is because none of these programs want to take a chance of "repairing" an uninfected version of "Whiz-bang-space-aliens v1.2" just because it looks sort of like it is infected by a virus. We are extremely specific in our check criteria in order to avoid this unfortunate consequence.

>ended the dialog handler with form_dial(FMD_FINISH, cx, cy, cw, ch, 0,
>0, 0, 0);. Apparently this only sends a redraw to a null rectangle
>rather than the one defined by cx cy cw ch.

Just to be totally trivial, the reason this occurs is because
form_dial(FMD_FINISH) has the format

form_dial (FMD_FINISH, small_x, small_y, small_w, small_h,
big_x, big_y, big_w, big_h)

where the small_ and big_ variables correspond to rectangles for growing
and shrinking box effects. Supposedly these are ignored by FMD_START and
FMD_FINISH, but from your experiences, they're not.

From: gjwelych@wotan.uucp
Message-ID: <1169@cmx.npac.syr.edu>
Source record: 249718

Hi there. I just purchased a Sheagate ST4096 80Meg full height hard drive, and would like to know which hard dive kits are the best?

I have various questions about the kits:

1) Which kits support full height dives?
2) Which interface hardware is the best?
3) Which softare best supports an 80Meg drive? How many partitions are allowed? Auto-bootable? Whats the maximum size of a partition? Is it compatible with Minix or other OSs?
4) How large is the case? Does the fan make alot of noise?
5) Which Adaptec interface is the best for a MFM drive?
6) Which kit is the fastest? Which is the easist to put together?
7) What are the prices?

Please Email me directly. If anybody wants me to summarize, send me Email.

Thanks in advance for any and all replies.
Greg Welych.

> computers only boot a new hard drive from power up but not an old SH204.
> Performing a coldboot will then boot up an SH204.

Atari has started buying DMA chips from a new supplier. The new
DMA chips are not compatible with some older DMA host adpaters. So some
older third party hard drives and Atari SH204s won't work with the new
STs.

I have a question about the Atari ST screen-dump (which can be invoked
by typing ALT & HELP at the same time.

My question is this: Does this screen dump work with non EPSON compatible
printers? If so, which ones (and how can it tell what kind of printer
is connected)?

Thanks in advance,

Eric Terrell (att!druhi!terrell)

In article <7829@chinet.chi.il.us> saj@chinet.chi.il.us (Stephen Jacobs) writes:
>Before I try out my 3 best guesses, I thought I'd ask for advice on this one:
>I'd like to have a particular program plaster a big dialog box on the screen.
>After the dialog is over, I'd like to get the screen redrawn properly (natch')

From the Laser C manual:

"Any rectangular area of the screen can be invalidated by calling form_dial
with a value of FMD_FINISH. The rectangle will be redrawn by a series of
events for all windows covered by it."

>3) Make a buffer. Save the area under the dialog, and restore it at the end
>of the dialog. How dull; how memory-hungry.

Actually, that's a nice solution. Memory-hungry is may be, but it is a much
faster solution.

It is interesting that just now people are mentioning problems with mice, because I just had one surface on me this week. This USUALLY happens after I've been using my machine for a couple of hours, but it's not predictable and sometimes happens as soon as I turn the machine on. Moving the pointer with the mouse (not the key equivalents) will cause it to jerk its way over to the left side of the screen. Also, it generates constant keyclicks as if a key is held down. I can only presume it is generating the escape key because if I am in the normal desktop, for instance, with a directory window open, it will cause it to repeatedly update. Hitting a key will stop the keyclick, at least until I move the mouse again. I can move around normally with the alt-arrow keys, although sometimes they seem to work more slowly.
I doubt that it is the mouse itself, because a couple of times while this has been happening I unplugged the mouse (Yes, I know it's not a good idea to plug/unplug things from the system when it's on; I try very hard to avoid that.) and the keyclick continues.
I thought it might be a broken line in the mouse cord, but I fixed it in place on it's back with the ball taken out and gently rolled the horizontal roller with my finger, and I get the same effect.
Another reason I doubt it is the mouse is because another problem has simultaneously arisen. When I first turn my system on after a period of non-use, it will not even access the drive (I have a 1040), but will display in low res a string of bombs straight across a white screen. Turning it off and then back on it usually proceeds with a normal boot. Sometimes it will start to boot and then hang about halfway through.
Both of these problems I have to live with until the end of the week, because I have some work I really have to get done, but I'm going to take it in for service after that. But I'm just curious if anyone out there has had similar problems, or if they have opinions or solutions about this one.

One final request. I assume this must have been covered in past digests, so could someone please email me the issues that cover using metafiles in programs (using ones that have already been created) and the .GEM file format? I can't find info on it anywhere.
Sorry this was so long,

Michael Kieras

P.S. It isn't loose chips; I've opened up the machine and pushed in every socketed chip. Twice.

---

regarding redraw messages: there is a better (i define better as more general) way of forcing a redraw using the appl_write () function. it is more tricky but once u master it, it is more like a general interprocess message passing utility (i.e. send a message to the current appl, or to and from an accessory). most applications are written with some sort of evnt_multi () loop that checks for messages, timer events, keyboard events, and button events. one of the messages which is looked for is WM_REDRAW.

tim oren's GEM tutorials presented such a "self redraw" code. the code fragments recently posted are ok to do the actual redraw.

the only trick involved with using the appl_write () code is getting the correct application id. i was having some problems and found out that gulam was somehow messing this up. invoked from the desktop, everything worked fine. most texts on GEM say the appli_init () function returns an application id (apid). this MAY be the case on PC GEM or with some compilers on the ST. however, at least with (beloved) alcyon, the AES bindings (AESBIND) export a global 16-bit int containing the proper gl_apid to use. don't use the return value from appl_init (unless your compiler bindings say it's ok).

```
main()
{
extern int gl_apid;

appl_init ();

/* now gl_apid contains the id of THIS application */

}
```

u can use appl_find () to get the id of any other gem application in memory (like .acc's).

if youse guys want, i'll post a small example...

> Perhaps someone who knows more about this will comment.

> I have used "lc" since the early 70's,
> When was System V introduced?

lc is a XENIX-ism. It is, in system 5 jargon, equivalent to ls -C.
It forces ls to produce multi-column output with the entries sorted
down the column (as opposed to ls -x which sorts across).

Some system 5s come with lc just to humor the XENIX users - ENIX
is an example. I don't have my 386 5.3.2 manual here but it may
have been added by ATT in that release just to humor people but
I can promise you it isn't standard in release 5.3.0 from ATT.

The solution of course is to get a complete set of our pocket references
on all flavors of UNIX so you can play mix and match games :-).

Here is a little more information:
As far as the human factors and features I like it less than
Publishing Partner with the exception that it really uses GEM so
you can do such things as have multiple text windows and/or pages
on the screen at once. This means that you can call up a text file
to merge into a page, edit it to select what you want and then transfer
it.

Another real nice thing is that if you insert text in existing text it
is in the font of the existing text instead of the default or last used
font. Further, you can find out what font and size text is in.

Another nice feature is the ability to set the text and background
"color" (8 gray levels for dumb printers, any % for PostScript printers).

What it won't do is any graphics other than boxes and lines. It is really
a page layout program suitable for publishing a newsletter or newspaper.
It doesn't do color separations or draw pretty boxes with round corners or
any of that other funny stuff.

What it does is work. I have yet to blow it up although there are
certainly some things that I don't know how to do as yet.

And, A QUESTION: anyone know how to generate the characters above 128 in
the character set. They publish the character set on pages 183-4 of the
manual. Things like trademark symbols and bullets exist but I can't
figure out how to generate them from the keyboard.

That's it for now - nore info as I figure it out.

Message-ID: <15240@cup.portal.com>
Source record: 249728

I've seen that rumor as well. The company that is currently advertising in START magazine, WestCo has announced a price of $1,300 for their removable system with drive, and interface, but rumor has it that the ICD host adaptor will do the job of the interface at much less cost. Also, this is noweher near the $300 price mentioned and another rumor is that the entire Westco project is now on hold. I would assume that since our cousins in the Mac world can get 45 meg removables at around $1,000 that the $1,300 asked by Westco is a bit much for their 20 meg removables. Of course this may all have nothing to do with the $300 removable - confused? I am, thats why I just swapped my 30meg mech for a 50meg mech instead! :-]

208. Fun With Your Hard Drive Project

Newsgroup: comp.sys.atari.st
Date: 1989-03-02 04:18:13 UTC
From: src@cs.odu.edu
Message-ID: <7958@xanth.cs.odu.edu>
Source record: 249730

A couple of months ago, I posted asking for help with a hard drive project I'd been working on for my ST. I received lots of suggestions and some very good advice. I especially thank the Atari reps who offered help -- some good people work there.

I'd like to pass along some of the experience I've gained from all this. The drive I built is comprised of a Seagate ST-277R hard disk, an Adaptec 4070 controller board, and a Supra host adapter board. The result is a 60 Meg (formatted) hard disk drive with a battery backed clock/calendar, DMA pass-through, and the potential to add a second inexpensive RLL drive easily.

Rule number 1: Don't trust mail-order!! I looked at ads in Computer Slobber magazine until I found some really low prices on the hard drive and Adaptec board. I stayed with the larger advertisements, thinking that those with the money to advertise big would be more reputable. I wound up with a bad hard disk _and_ a bad controller board for my efforts. The hard disk would not reinitia-lize to track zero. The controller board caused crashing whenever a file was read from the hard disk. And although I have some technical experience, it takes a major investment in equipment and understanding to troubleshoot a setup like this. Expect to get burned!

My approach was to call each company, describe the problem, and send the item back for testing. I had to call Seagate directly about the first hard drive before the mail order company would accept a return. It took three days of repetitive dialing and "eternal hold" to reach a human being at Seagate -- but after that they were quite helpful. They described the problem with the drive and said that it needed to be replaced. They also told me the mail order company I was dealing with -- Computer Terminal -- was not an official Seagate dealer and was not supported by them.

Supra was the shining star of the group. The help I received from them was invaluable. The fellow I spoke to there (Mark) warned me that bad drives and bad controllers (even counterfiet ones!) were "out there". They had me return my Supra board, but found nothing wrong with it. They replaced a couple of the chips with new revisions anyway, and mailed it back. I had originally chosen Supra because their SCSI Host Adapter was cheaper than ICDs, and because their software wasn't copy protected and _was_ highly regarded. Supra's HD utilities are PD, and can be downloaded from GEnie. Great people!

My Adaptec board was the major source of problems. The 4070 needs to be shielded in order to work, when installed against the bottom of the hard disk (it is drilled for mounting in that position). At Supra's suggestion, I enclosed a piece of aluminum foil in some cardboard, connected an alligator clip to the foil and grounded it, made sure the whole assembly was insulated, and slipped it between the controller and the hard drive. This provided a good

shield.

Unfortunately the first Adaptec controller was bad, in an insidious manner. It gave errors exactly as if the shielding was inadequate (noise interference). This caused the programs I executed from the hard drive to bomb immediately. Finally I got permission to mail this board back to Computer Surplus, while it was barely in warranty. They sent me a replacement as soon as they had one, in spite of the fact that in the meantime, they'd changed distributors -- and the price was now $40 higher! Pretty decent of them, considering.

So, after three months of hassles, about $60 in phone calls and about $700 in hardware -- I have a functioning drive. I'm very pleased now that it works! Backing up a 60 meg drive onto floppies will be formidable, but it will take a long time to fill up this much space. I suggest that anyone planning on making an ST hard disk in this challenging manner have lots of forbearance. One has to constantly trade the urge to get momentary satisfaction for long-term results!

>>>Scott

I'm sure you know by now just how responsible I think Compute! was in
publishing virus source code...

The thing about disassembling a virus is that first you need to HAVE an
example to disassemble... if the (stereotyped:nasty teenaged hacker with
nothing better to do) can't get hold of one to study, maybe he'll go make
explosives in his garage with the instructions he downloaded from the
local BBS instead...

Publishing source code for a computer virus is like handing out plans for
zipguns at a racially tense high school... maybe 99% will just look at them
and throw them away... then again, maybe they won't...

Jeff Riegel asks:
>Has anyone heard about a maze editor that can be used with Dungeon Master?

This is a program out of England, a demo version of which was included on a "disk magazine" which has the interesting feature of being a "flippie" disk, with Atari ST material on one side, and Amiga material on the other..!

(Hmm... should have said "disk included with a magazine" up there...^^^)

Anyway, it's NOT a Dungeon Master *maze* editor... (unfortunately..!)

It allows you to edit a Saved game file, and change several different kinds of things... you can delete things... like wall sections, to allow access into places you haven't been able to get into..

There's a "Global" option to change ALL doors into the kind with a simple button to open them... (no tricky stuff needed to open them any more)

Also, there's a Global option to make ALL "hidden" doors *open*.. (all those wall sections that open when you whistle Dixie while holding your left ear..)

Other than that, there's an option to print out the maps of all the levels, and that's about it..

If you operate on a COPY of your Saved game, it might not involve too much danger, but the Saved file is pretty touchy about how much it will tolerate as far as these changes... it's a pretty complex compressed image of the entire Dungeon and too many edits, or one in the wrong place, and the game may lock up... and the down side of it is that the crash may not occur until long after you've made the changes, after you've fought your way down through all those nasty Levels... suddenly... CRASH...

Just remember not to blame FTL or Dungeon Master, if the Save file has been edited...!

I really wish it *had* been a true "maze editor"... I'd love to be able to create my own Levels for Dungeon Master while waiting for DM II to be released..!

:)

I'm _very_ certain that the screen dump works only with Epson printers,
in Monochrome mode, and with the Okimate 20 Color Printer in Color Mode.
BUT for the Atari Laser Printer (SLM804) there's a screen dumper that
steals the Alt-Help and outputs the correct data over the DMA to print
to the laser printer...

Sorry Greg, but I doubt that's it.... Many people I know leave
their machines on 24 hours a day (at home). I've had mine "on" for
nearly 4 years now with the only mouse failure being when the little
rollers inside the mouse got dirty. I cleaned them up and used a
mouse-pad after that and haven't had a problem in the last 3 years...
(This is the typical mouse failure story from many of the people I've
spoken to...)

Not necessarily, since the Panasonic 1091 is Epson compatable (at least mine
is).

And by the way, the reason you're getting 3/4ths of the screen is probably
not due to 80 columns, but because the ST thinks you have 1250 dots across.
Try using the Control Panel to "Set Printer" to 960 dots, and see if that
improves the situation.

Does anyone know anything about obtaining PD dictionaries
as robust as the ones found on university systems... that
i can put on my hard drive?

Also, where can I learn about crunching a dictionary so
that a fairly sizeable subset can fit on a floppy...

What are the best search routines?
Do i need to design my own data structure?

Thanks for the help.

224. CompuClub and Atari repair policy

Newsgroup: comp.sys.atari.st
Date: 1989-03-02 18:31:24 UTC
From: kchin@BBN.COM
Message-ID: <8903021847.AA13048@ucbvax.Berkeley.EDU>
Source record: 249746

Hi All,

My brother-in-law had a problem with getting his 1040ST repaired, a problem which has turned into locating his now missing 1040ST. Does anyone know what happened to CompuClub in Framingham, Mass., which is where he sent his machine? Their phone has been disconnected recently and I assume they have gone out of business.

Now the more general question is this: Before CompuClub disappeared, they had told them that they had sent his machine to Atari for repair. This is in July of last year. Calls to customer service in Sunnyvale, CA have only gotten him recordings. Who can we call to find out if Atari has his machine? Is there a *real* customer service at Atari?

Any and all info appreciated,

Ken Chin

>original...) then the memory clearing code is just ignored. ...
[Rest Deleted]
Last four bytes of which part of the program just loaded? The last bytes of the Text, Data, BSS, Symbols, or what? If it's the last bytes of the file, these are currently undefined, and in fact they're used by MWC executables. Who puts the four bytes there? The linker? The User? What's to guarantee that the magic number isn't there now in some executable file?

Basically I think this is old news. Forget it. There's a lot more important things for Atari to do with the ST; like how about multichannel DMA and a real MMU and some hardware for that Mega Bus and an expansion box for it and some ATARI SUPPORTED network hooks built into the OS and FORWARD SLASHES and virtual file systems and ... :-)

Yes, Virginia, there is an International ST Software Catalog, and
it's put out by none other than Atari itself. It should be available
at any Atari dealer. If you're in the West Coast, it should be available
at Federated.

To be listed, I would imagine that you should be an official Atari
developer. You should contact Atari about this. If you don't know
by now, here's the address:

Atari Software Catalog
PO Box 61657
Sunnyvale, CA 94088

|
|
|
|Eric Terrell (att!druhi!terrell)

This does not work with 24-pin EPSON printers, at least with LQ1000 series.
The ST sends a command (ESC 1) which sets 7/72 inch line spacing.
As 24-pin printers spacing are only 1/60 inch spacing, they do not reco-
gnize this command and so you can't dump screen on them.

Naturally, only experience can tell you this fact (-(-

The needed printer codes are: esc L (graphic data), esc 3 (1/216 spacing),
esc 1 (1/72 spacing).

2400HZ Crystal phase lock Weather Satellite decoder
Updated by Mike Gore March 1989
Part 1 of 3
==========

This posting is broken into 3 parts. Part 1 contains a functional outline of the decoder and some information of interest on the NOAA and Meteor weather satellites. Part 2 contains the decoder diagram in ascii text format. Part 3 contains some functional test software written for the ATARI ST. You are encouraged to extend/modify this to other machines and to add improvements. I hereby place these postings in the public domain. My hope is to stimulate other people to get involved and share ideas in this in testing area.

Background:

The NOAA and Meteor weather satellites transmit images of the Earth using an APT format [Automatic Picture Transmission]. The image information is encoded with a 2400HZ AM audio signal that is transmitted on a FM modulated VHF downlink. The amplitude of the 2400HZ signal represents the surface brightness at a given instant scanned by a rotating mirror. The image format is 120 per minute for Meteor and lines per minute for NOAA. Frequencies in use are are 137.5MHZ, 137.620MHZ for NOAA and 137.300MHZ, 137.400MHZ and 137.850MHZ for the Soviet Meteor satellites. The receiver bandwidth must be at least 30KHZ or more for good results.

The NOAA craft transmit both visual and IR images where the Meteor crafts only send visual band images. The resultant image is therefore the sum total number of scans you are able to receive before the satellite drops below your local radio horizon. There is thus no concept of vertical sync other then indirectly by whatever range of scan line you may happen to choose when displaying a final image.

After demodulating the 2400HZ AM signal one is only left with the original amplitude. Beside having brightness information the demodulated signal for NOAA satellites has a 1200HZ sync burst to flag the start of a given scan line whereas the Meteor craft uses a 300HZ sync.

For my receiver I used a Radio Shack PRO-26 scanner but I had to replace both ceramic IF filters. For the 455KHZ filter I use a muRata CFM455A and for the 10.7MHZ filter I used a muRata 10.7MA. I should mention that the CFM455A is larger the the original filter so you must lay the filter on its side on top of the MC3361. For the 10.7MHZ filter you could use most any 3 terminal filter used for many FM radios with around 1 to 1.5K impedance. For best result you must adjust the preamp in the PRO-26 to recenter the

passband near 137.5MHZ. For my antenna I chose a turnstile antenna with a 2 stage FET preamp. Very useful information may be obtained from either of the 1987, 1988 or 1989 ARRL Handbook published by the American Radio Relay League. Also I would suggest the ARRL Antenna Book for anyone seriously interested in experimenting with various antennas.

Circuit description:

My demodulator uses a passband network built of 2 high and 2 low pass filters. The stop bands are currently 1200HZ and 3600HZ however this value was somewhat a matter of experiment on my part. The filter feeds a full wave active rectifier that can be balanced with a 10K variable resistor. The rectifier part is similar in form to that found in several National Linear AP Notes yet I liked the version in the 1987 ARRL handbook enough that I used theirs. What follows the full wave rectifier is a resetable integrator followed by a sample hold. The DG201 analog switches are made by GE Intersel. The op amps I used were the TL082 dual or TL084 quad op amps yet LF353's just as well.

I chose to use the resetable integrator rather then a low pass filter after a rectifying stage so as to push the overall demodulated bandwidth of the system to the limit. The results are very good, the main advantage here being that aliasing errors are virtually gone because the integration period is synced with the 2400 AM carrier. The integrator may be run at half cycle intervals but the circuit described here is wired for 1 cycle samples. In order to phase lock the system clock with the 2400HZ AM carrier I chose a Crystal VXO design for very stable operation.

In order to be able to record on tape I shaped the output of the VXO into a triangle wave in order to drive one channel of a stereo tape deck. During play back I use a simple PLL onto lock to this signal and provide timing uneffected by any residual wow and flutter. It is this last analog PLL that actually drives the switchable integrators and A/D converter timing. So that the VXO can run closed loop the analog PLL must see a copy of the shaped VXO signal during a recording session. If a tape deck is removed from circuit you just need to jumper the shaped VXO signal to the analog PLL input in order to let the VXO run closed loop.

If there is no need to record signals on tape for later play back at all you can remove the analog PLL and VXO wave shaping circuit. To do this just jumper pin 14 of the MC14020 to pin 1&2 to the 74LS164 directly and remove any left over connections from the 74HC86 XOR gate (pins 4,5 &6).

Some may wonder why I just don't use the analog PLL by it's self and skip the VXO all together. Part of my reason for not doing this is because the analog PLL is not nearly as stable nor noise immune as the VXO. Any phase errors in the system will cause amplitude errors which reduce the whole usefulness of using a switchable integrator design in the first place. Also I use the VXO to create basic timing to such accuracy that in fact I no longer even need to examine the sync information transmitted in the APT signal. The loop time of the VXO is so slow that noise does not impact the VXO much. Ok, so why not use an analog PLL with very slow loop time then ? The

answer for this is that drift is a serious problem in setting and maintaining an analog PLL whereas a crystal does not suffer from shifts in the center frequency. Remember that the loop response time for the PLL must be very slow and as the center frequency drifts the time for the loop to close increases. Lastly because a PLL is used for timing we need to restrict how far the loop frequency can actually move.

For NOAA I found with it's scans of 240 lines per minute and also with two images interleaved on alternate scans there isn't much bandwidth left over for image detail. This need for maximal bandwidth led me to choose the VXO design after much experimentation. I should note that the Meteor satellites run their carrier slightly off 2400HZ and my system can not phase lock on their carrier - in fact there doesn't seem to be a strict 1 to 1 relationship between carrier frequency and scan rate as is the case with NOAA. The loss of lock still gives very good images but not as good as they could be. I should mention that when the VXO loses lock it stays near it's center frequency so it remains useful for timing to a very high degree of accuracy. Regardless of the carrier differences the scan rate for both satellites is *very* accurate - enough so that one doesn't even need to use the sync information to maintain sync. In fact in the final data collection software I chose not to use the sync burst in favor of a manual software offset adjustment in the final display program.

The VXO uses a standard XOR phase comparator for locking yet there is no loop filter needed by design. It works out that the phase jitter is to small to even worry about with only an 8bit A/D. Basically the XOR gate forces the 2400 divided reference clock to be roughly 90 degrees out of phase with the downlink 2400HZ carrier. The crystal I used is series tuned such that when the analog switch closes the frequency runs low and when it is open it runs high. The 20pf cap across the switch adds to the switch capacitance to give a minimal value to keep the oscillator stable. The idea is to weight the two values of frequency with the switch open and then closed such that it averages to 2457600 MHZ with about +/- 150HZ swing when switched. The swing must at least be in excess of the worst case doppler shift - the higher the value the faster the lock yet with a chance of larger phase errors as a function of noise. This circuit works very well at locking on a signal almost totally lost in noise much unlike what one would expect with a simple analog PLL. Of course a noisy signal is of no real value yet even noise bursts can cause loss of sync with a normal non VXO analog PLL design. Also any phase errors that can occur will cause aliasing errors in the recovered amplitude at a rate determined by the loop lock time.

Software:

The code included was complied under Mark Williams C 3.0.9 on the ST.
It works in both Mono or Color modes.

The data collection program takes 1 argument which is simply the file name to save the collected data with. This program displays a digital scope style profile of the signal as it's being saved to disk along with the current line count. You may stop and close the file at any time by typing any character. The program will also stop and close its files if any kind

of write error occurs [such as a full disk and so on].

Example: get afile

The display program takes 4 arguments.

Example: disp afile 100 900 -hs2

Argument 1 is the file name, 2 is the line count to skip when reading
the file, 3 is the image offset and 4 is a a list of flags.

Flags:
c - contrast enhance
h - histogram equalize
s - flip image
y - correct aspect ratio of NOAA images
2 - magnify 2x
3 - magnify 3x
4 - magnify 4x
Notes:
You can not use both "c" & "h" at the same time.

Example: disp afile 100 900 -hs2

Credits

Many thanks go to Alan Paeth for letting me use a well tuned version
of the Floyd error diffusion method he implimented for his IM Raster Toolkit.
It provied a main basis for my final monochrome display driver.

235. Crippled mice

Newsgroup: comp.sys.atari.st
Date: 1989-03-03 12:09:00 UTC
From: ivan@rzsin.sin.ch
Message-ID: <91
Source record: 249607

I was interested in the messages last week about mice "dying", because one of our rodents started exhibiting the same behaviour (only moving horizontally & not vertically) the day before. The messages suggested to me that the cause is the loss of pulses on one of the four outputs (two for each axis), and blocking the light-path to one of the phototransistors on the good axis duplicated the behaviour on this channel too.

A little bit of investigation showed that each phototransistor is connected between +5V and a resistor to ground; the signal developed across the resistor is then fed to one section of an LM339 quad-comparator. The reference for the comparator was 0.20V, and the output should switch between 0 and 5V as the input passes through 0.2V. A multimeter showed that one signal from the faulty axis was only just coming up to 0.2 while the other three were reaching up to 0.3 to 0.4. Obviously the circuit characteristics had changed enough with time that the output pulses were no longer being reliably generated. The quick fix was just to increase the sensing resistor from 470 to 820 ohms, since for small signals the phototransistor should develop a given current flow; passing this through a higher resistance gives a proportionately higher voltage.

I hope this info might be of use to anyone with a dying mouse and a little bit of electronics equipment (hint: SolderWick or a SolderPuller are highly recommended when unsoldering the resistor, as the circuit board is easily damaged).

Does anyone have any experience using the ST/PC Drive Cable from E. Arthur Brown Co.? This cable supposedly allows you to hook up any IBM compatible 3.5" or 5.25" floppy drive to the ST. Is this something that I can easily make myself? Can I run the second drive off of my existing power supply somehow? Any comments appreciated.

If you have Laser C, you should seriously consider getting the
upgrade to the newst version, and then get the Laser C Source
Debugger. It's an excelllent debugging tool, and it works flawlessly
in the Laser C environment. (It also works well from Gulam)

238. Quick Directory Size

Newsgroup: comp.sys.atari.st
Date: 1989-03-03 16:44:24 UTC
From: iadt2tg@prism.gatech.EDU
Message-ID: <305@hydra.gatech.EDU>
Source record: 249610

What is the quickest way to find out the total byte size of all files
in the current subdirectory? I need the size to do the equivalent of
a "ls -l", and I'd rather not add up the individual file sizes.

239. MWC Rsconf() return value?

Newsgroup: comp.sys.atari.st
Date: 1989-03-03 17:23:51 UTC
From: csrobe@CS.WM.EDU
Message-ID: <8903031723.AA06330@cs.wm.edu>
Source record: 249611

I've been working no the UUPC code and noticed that the original code
(compiled with a different compiler) has a return value for Rsconf().
I looked in the _Atari_ST_Internals_ and the c-code fragment shows
Rsconf() as "void". BUT!, if you go to the assembler listing in the
back of the book you see that the asm code shows a long being returned
in D0.

I looked in <osbind.h> and Rsconf() is just a macro for xbios() which
does indeed return a long. I changed the macro in <osbind.h> to be
of type "long" and it works -- i get the original values of the registers
as a return value. If you have MWC you might want to modify your
<osbind.h> to do the same.

Now if I could get the two systems to complete a connection...
cheers,

Here's something I pulled off a local BBS that I thought might be of
some interest to netkind.

==========
ST World
==========
presents

WORLD OF ATARI
APRIL 22-23, 1989

ANAHEIM, CALIFORNIA
DISNEYLAND HOTEL

o Atari Game Machines
o Atari 8-bit systems
o ST and Mega Systems
o Seminars
o Workshops
o Thousands of Super Sales!

Airfare, car rentals and lodging discounts available to
exhibitors and attenders. Discount tickets to user groups.
Call (503) 673 - 2259 for additional information.

*** Show area has been increased to 28,000 SQUARE FEET.
Fourteen times bigger than Atari's area at Comdex.

*** PC DITTO II will be shown for the FIRST TIME at the
show. Avant-Garde will be revealing the "secrets" of PC
Ditto II, a 4.77MHz IBM emulator for the ST, there.

*** GADGETS BY SMALL will introduce SPECTRE GCR - no
need for the Translator anymore. Use Macintosh software
right from the box.

*** ATARI, CORP. is behind the show 100% and will be
showing their new MIDI synthesizer, GENLOCK, and the new
ATARI ULTRASCRIPT LASER PRINTER.

*** FLEETWOOD MAC will be entertaining the spectators
with a concert.

*** WASTECH will be demonstrating their new monitor,
which will allow ALL THREE RESOLUTIONS to be shown on a
single monitor.

*** INTERLINK will be unveiling MASTERLINK, the new,
improved telecommunications software package.

*** HAPPY COMPUTERS will be there with their DISCOVERY
Cartridge, the program that will copy ANY program on
just about ANY format.

*** MIGRAPH will be demonstrating TOUCHUP, a graphics
package to aid in Desktop Publishing.

*** MEGAMAX will be showing LASER C, a very fast C
compiler.

*** GRIBNIF Software will be there with NEODESK 2.0.

*** ANTIC (START magazine) and ST-LOG will be there.
Possibly even MORE magazines.

ALSO, World of Atari will be at Dearborn, Michigan June
24-25, 1989 at the Hyatt Regency Dearborn. 18,000 square feet
of space. Make your plans early to attend this great event
for Atari users. (All of the events mentioned for the
Anaheim, CA show may not necessarily appear at the Dearborn,
MI show).

>explosives in his garage with the instructions he downloaded from the
>local BBS instead...
>

I have to disagree. By making this statement, the implication is that
viruses are not a problem. If it's *so* difficult to get a virus,
then why is everyone up in arms about viruses? If this deranged
teenager has access to a BBS, he certainly has access to viruses,
since BBS's are prime vectors of infection. Folks will always resist
when others put controls on what they can and can not do and putting
controls on information is no exception. Trying to stop the flow of
virus information is like the war on drugs--if you can't get it here
then just walk down the block. The Internet is not the only source of
information about anything. If folks can't find what they're looking
for here, they'll just go somewhere else. I'd rather not see that happen.

>First, why are we talking about this here on the TOSed os newsgroup?
Because "lc" is a nice command to have on a command line interpreter.
In my first posting, I gave an example that showed what was wanted.
Your example (not repeated here) shows the right stuff. "lc" is not
specific to unix, as I stated in an earlier posting, but for some
folks, it has been ported there. Those who have "lc" aliased to "ls
-C" are missing something, if they do not know about the good stuff are
culturally deprived. Too bad.

I think we may have the right thing before long, to run on the Atari ST,
under TOS. OK?

```
The easiest way to force a redraw of everything on the screen is to perform a
form_dial(FMD_FINISH,0,0,0,0,dx,dy,dw,dh);

where dx, dy, dw, dh are the maximum area of the desktop as returned by the
call wind_get(0,WF_WORKXYWH,&dx,&dy,&dw,&dh)

This will force a redraw message to be sent to everyone. This is by far
the easiest way to get other applications to redraw. If they don't do it,
some DAs won't handle redraw messages, then they don't do redraws.

How does a program do this? Presumably terminate-and-stay-resident, but how does it intercept keypresses?

A couple of years ago Moshe Braner (where's he gone?) posted a program which did this but it shoved the screen into a reserved area of memory he called the "barrel"; then you could dump the barrel to a Degas file. I'd like to try writing a program which instead created a .TNY format screen file every time alt-help was hit.

Very much in the same vein: I just got a NEC Multispeed MS-DOS laptop (used--
mostly for use as a second terminal to do debugging on the ST). It has a funny
connector on the back, and there is a claim that it can pretend to be
external floppy drives on a desktop MS-DOS machine. Can the same thing be
arranged with an ST? Believe me, it would be the steal of the century if that
portable could pretend to be a pair of double sided drives for my ST.

The standard (in the ROMs) screen dump routine is for an Epson compatible
printer. What sort of printer do you have that isn't Epson Compatible?
From what I understand almost all printers have available an Epson :
compatible mode. Some of the others are Epson compatible but the dump
doesn't work properly for one reason or another. There are PD programs
around which allows the use of the Degas style of printer drivers to
replace the standard. Also there is a program for the 24 pin printers
which definitely works for the Star NX2400 printer which gives excellent
printer dumps.
I still have a friend looking for a printer driver for GDOS which will
give better definition for the Star. He has been told of a driver in the
PD which will work for GDOS for the Nec P6/P7 printers which should work
for the Star. Has anyone seen these available for download anywhere?

> The screen dump works fine on my Panasonic 1091i, although I only get
> 3/4 of the screen since it's an 80 column printer. As far as I know,
> the screen dump should work with any IBM compatible dot matrix printer.

There is a modification you can make yourself using your control panel
and then save in the DESKTOP.INF file. One of the settings for the printer
960 or 1280 bits/pixels per line. Set the printer for the 960 and you
should be able to see the entire screen dumped.

Hope that helps.

Source record: 249623

Regarding the recent probems with mice, I shouls probably talk about the problem I have just being having with mine. On Thursday morning, I awoke to find that it would not move up, yet it would move down. After some experimentation, I found that the problem seemed to be allievated by tightening or loosening the four screws that hold the mouse together. I now have it working once more, although the amount of clicking that the left mouse requires is now negligible. I have replaced it with a MALAYSIAN mouse, as previously I had a TAIWANESE mouse. I do not if one or the other is better, or if this "fix" for the TAIWANESE mouse will work for others, but I offer it none the less for your edification.

John, I'm not sure how this SDUMP program does this itself, but I would
create a terminate & stay res as suggested, and then sit on the keyboard
interrupt vector -- find the appropriate keys in the packet coming in
and just not pass them to the system. Once you've got contrl there,
you should be able to do anything with the screen... Don't know about the
specifics (use Kbdvbase() to grab the system keyboard vector, that's about
all I know), sorry.

lc stands for 'list catalogue' and existed back in the good old V6
UNIX days, which predates XENIX and Microsoft. Lc was originally
written in 'B' and ran on a honeywell at Waterloo because the
catalogue listing commands, like most of the software that honeywell
produced, was rather 'quaint'. (how about 'ACCESS MF foobar' to
change the file attributes... blech)

Needless to say, its been ported quite a bit.

Lc (the one from the net) tends to follow me around where ever I go,
though I never even thought of porting it to my Atari :-).

I use Dr T's Copyist and within its limitation of page size find it very satisfactory. It successfully handles problems such as polyrhythms, transposing instruments, movable clefs that other editors ignore and has provision for user-defined symbols to fill in the gaps they forgot about (like string articulation symbols). The finished results are quite indistinguishable from professionally printed music. It isn't really suitable for orchestral music because of the small page size, but for piano, organ and chamber music, as well as songs, it is perfect.

> I would like some information of NeoDesk (and any other
>GEM interface/substitute). Specificly, I'd like to know;
>- how much memory does it use (or save)?
>- how configurable is it?
>- What does the program do that GEM does not do?
I am running under NeoDesk V2.00, it is a BIG improvement over the DeskTop.

1) Memory requirements: NeoDesk V2 can be run in 2 modes. One mode leaves
NeoDesk in memory all the time; this mode uses up 150K of RAM. The other
mode leaves only the "Master Shell" in memory when an application is
invoked then reloads the rest of NeoDesk when the application terminates;
this mode uses only 24K.

2) NeoDesk is VERY configurable (and the .INF file is even readable: it
uses DECIMAL numbers and contains comments identifying the fields).

3) NeoDesk does many things that the regular DeskTop won't do, so many that
I will not be able to list them all (I can't remember alot of them).
Some of the additions are...
7 Windows, "printer" icon, "rubberband" box works in ANY direction
(not just down to right), 128 character parameter line for .TTP
parameters (and selection of multiple files enters all file names
in the parameter line), Selectable "sort" including "nosort"
(usefull to see actual order of files in folders), Environment
Variables, Applications may be "installed" on two different file
entensions, New "program" types: .BAT and .BTP (Batch and Batch
Takes Parameters), Batch jobs run on user selectable
"text command Shell", Drag an Icon extended to "move" files too,
Icons may be placed on desktop for quick access, Disk to Disk
copies can reformat the disk if necessary, An Icon Editor to
edit any of NeoDesk's Icons, A NEW Control Panel that includes
a corner clock and screen saver and will show actual state of
Blitter and permit you to change it, A Printer Queue Accessory,
A BOMB trap server that will print an "english" error message on the
screen (instead of just a bunch of bombs) and can display the state
of the registers when the bombs occured, Max. viewable files in
a folder can be extended to 999.

I am sure I forgot alot of things, but that is probably most of the additional
features that NeoDesk offers.... Oh, one more... a "push-behind" button is
added to each window (this will let you push the top window behind all the
rest, without having to resize or move it).

R. Tim Coslet

Usenet: R_Tim_Coslet@cup.portal.com
BIX: r.tim_coslet

P.S. I just use NeoDesk (and like it very much). I have no connection with Gribnif Software.

P.P.S The NeoDesk Control Panel also includes "warm" and "cold" boot "hotkeys": ctrl-alt-del and ctrl-alt-undo that may be used almost anytime.

Have him try calling Atari Customer Relations at 408-745-2367 or 5759, during
normal business hours (Pacific.) After hours, there's a recording; otherwise,
there are real human beings there.

I picked up the March '89 issue of ST-Log and it mentioned in the COMDEX report that a company named Castech in Grandview, MO has introduced a new COBOL compiler for the Atari ST. It is supposed to be ANSI '74 compatible and priced at $199.95. Has anyone seen it or used it or is near there to find out more about it? I would like to find out more about this.

Message-ID: <4499@cs.Buffalo.EDU>
Source record: 249630

Does anybody out there own or have programmed in OSS's Personal Pascal?
I'm having a few problems. First does Personal have a random number generator?
I looked all around and could not find one. The result is having to write
my own, but I would much rather use a built in one. Second how do you
clear the screen in Personal?? I know you can import the procedure
Clear_Screen from the GemLib but this does not set the cursor back to the
home position. Is there any clear screen or home function which does this?

Thanks for any and all help

Source record: 249631

Neodesk is a love-hate program, either you love it or hate it. While
I liked what I saw in version one, I hated the 120K memory it up
on my 1040. Now that I have version 2 I love it and would never go
back to the regular GEM desktop (I also now have a Mega 2.) Here
are the features of NeoDesk 2.0:

Optionally can use as little as 24K of memory
Fast icon and text drawing as well as window opening
Optional use of a picture as a desktop background
Unlike version 1, version 2 uses the new 'twisted' or 'fast' format
option up to track 82 and 10 sectors
Auto execution of any program or batch file on boot up
Files can be moved, not just copied, this is fully selectable
If a system crash occurs NeoDesk almost always displays information on
the bomb and the status of the registers
There is no horizontial scroll bar, icons are wrapped around to fill
the window so no icons are unseen off the right edge
Windows can be stacked and brought to the top at a mouse click
A window that is not active can be resized and scrolled through without
selecting it.
Disk Volume name is displayed when each disk is opened
Filenames can now be displayed instead of icons and there is an option
for 'small' text ala a Mac and options for date, size, and type are
fully selectable.
A replacement Control Panel is provided that includes a corner clock
screen saver and a 'warm' or 'cold' reboot from within any program and
a on-off control for the blitter chip.

There are other goodies, in my opinion with NeoDesk and Universal
Item Selector the ST desktop becomes a powerhouse, a must buy.

According to the April '89 issue of STart, FutureDOS (a Canadian company)
will soon be releasing an Ethernet controller board
called TAXI (The Atari eXtended Interface) for the 520s, 1040s and
Megas. (The 520s and 1040s communicate thru the DMA port, while the
Mega uses the internal bus.)

For further info:
FutureDOS R&D
1207-120 Torresdale Ave
North York, Ontario
M2R 3N7
(416) 736-0321

The price of the boards is expected to be in the $1K-$2K range.
(I dunno whether those are US$ or Candian$)

I saw the ad for the cable in E.Arthur Brown's catalog. What a rip off! I bought a PC drive cable kit from Best Electronics for $10! All it is is a 3 foot ST drive cable with a bare end, and a 34 pin connector. you just line up the cables coming out of the ST cable to the corresponding pins on the 34 pin connector. It is a ribbon-type connector, so you have to push the wire into the pronged end of the connector. I've built quite a few cables like this, with no problems. $40 is outrageous.

By the way, I have a Teac and a Toshiba 3.5 inch drive on my ST, so I guess the cables work. :^)

In article <4499@cs.Buffalo.EDU> ugmuldoo@sunybcs.UUCP (Thomas Muldoon) writes:
> ...
> First does Personal have a random number generator?

The easiest way to get a random number is with the XBIOS random
function.

```
FUNCTION Random : Long_Integer ;
XBIOS(17) ;
```

This returns a 24 bit random number.

> ...
> Second how do you clear the screen in Personal??

I usually use an escape sequence to do this.

```
write(chr(27),'E') ; { ESCAPE 'E' -- CAPITAL E -- clears the screen }
```

This information comes out of Atari ST Internals from Abacus
Software, but there is apparently another book available that is a
lot better organized, though the name escapes me...I can find it if
there's any interest.

"I called Data Pacific and
they said if my drives are more than 1% fast the format will not work.
My drives checked out at 304.5 rpm."

304.5 rpm would indeed probably be a little hot. There are two
PD disk utility files that you need so that you can find out for sure
if everything is ok. One is SEEKS and the other is, eek, I can't
recall! Sorry.
At any rate, if you've found a potentiometer then adjusting that
will correct the speed, but if you are faint-hearted, I wouldn't do
it. The pot is very sensitive and it might be tough touching it just
right to get the speed right.
I did it a long time ago on a previous drive that I had and was
shocked as to how sensitive the pot was.

Regarding the MouseTrap-type programs not working on the Megas. I've noticed that two programs which I have on myMega2 use their own form of trap: WordPerfect ST and MegaWatt.
WordPerfect's is the cleanest one of the two. Maybe someone could talk to the folks there and get their routine or at least, persuade them to release a version of what they call "Menu Bar Lock" into the domain.

273. sozobon with gemfast libraries

Newsgroup: comp.sys.atari.st
Date: 1989-03-06 09:01:45 UTC
From: agray@eriskay.axion.bt.co.uk
Message-ID: <1167@zaphod.axion.bt.co.uk>
Source record: 249645

Has anyone tried writing programs with Sozobon in conjunction with the GEMfast libraries yet? If so, have any problems with the AES library come to light. I have just cobbled together a quick program which has stood on it's head. The main problem seems to be within the 'form_alert' usage

```
#define NO_DEFAULT 0
...
appl_init();
...
switch(form_alert(NO_DEFAULT,"[1][Hello World][SHOW|PRINT|CANCEL]")) {
case 0:
/* show */
break;
case 1:
/* print */
break;
case 2:
/* cancel */
break;
default:
/* how does this get invoked? */
}
...
appl_exit();
```

This cameo example should return 0, 1, or 2 according to the selected option. Hitting 'PRINT', however, inevitably returns 2, 'CANCEL' defaults etc !!!. The main text string is irksome, apparently not handling the text bounded by '|' properly. I'm sure these problems would have been noticed during testing, so where have I gone wrong. (The Megamax manual quotes that the text message can contain '4 lines of 32 characters each' and in the following line '5 lines of 32' characters. The DR GEM-AES manual states '5 lines of 40 characters' the total not exceding 200 characters.)

What did I, rather than GEMfast, do wrong?

Yes, that does sound painfully similiar to the trouble I had.
In the end (a couple of weeks later), the mouse cursor just went
uncontrollable in all directions. My ST is unusable now.

The repair guy [who usually isn't too bad in fixing things] couldn't find
the problem either, but he is sure that neither one of the 'big chips (*)' is
causing the problem. Well I bought a new computer and try to fix the old ST
myself. I think of replacing the LS244 from the keyboard and the
'Kondensatoren' (I have no idea, what that is in English). I don't have
much hope though.

Just in case someone did fix a similiar problem:
"How did you do it ?"

(*) MFP, 6850, Keyboardchip.
^^^
He sez, that this is in the majority of cases the problem!

I think the chances, that the MAGIC number matches some long and
that the program _also_ requires zeroing of the data space are pretty much
'0'.
On the other hand isn't the blitter (I don't have one) able to do zeroing
of data? (At least it should be).
And, aren't there some unused bytes in the .PRG header of every
executable file ? That could be a better place to add a flag.

```
**************** line eaters **************** ************
&&&&&&&&&&&&&&&&&&&&&&&&&& breakfast $$$$$$$$$$$$$$ $$$$$$$$$$$$$$$$$$$$
-------------------------------------------------------------------------]
```

Hello,

we have mega-problems using the cartridge port on our MEGA ST2 and we think it is a common problem for all MEGA's with a boardrevision higher than revision 4. We use the cartridge/ROM-port to read data from an ADC to digitize satellite WEFAX-pictures from METEOSAT. The soft- and hardware works fine on a MEGA ST2 with a revision-4 board or a 1040STf, but it crashes (with 4 bombs) on any MEGA ST2 with a revision-5 board.

Our dealer (ECD delft) and ATARI Benelux (Netherlands) couldn't help us (yet?), so we would like to ask if there is somebody on this net with enough inside knowledge to help us. We would like to find out if there is a software or hardware difference between the mentioned boardrevisions, and if so what these differences are.

Aad & Jos

In response to a lot of the mail I've received:
1) You haven't missed the "rest of the chapters". I'm posting them as I get them written.

2) You may not agree with me. I tried to set down the definitions and terms as I would be using them, for the benefit of those who weren't familiar with them. This whole area is rather vague, and most of us in the trenches and making up the rules, as we learn the game.

When we left our virus at the end of Chapter 1, it had managed to get itself installed in our system by being present on the boot sector of a disk in the machine at cold start or reset.

Another way a virus may be installed is via a trojan horse program. Trojan horses come in many flavors. Some disguise themselves as programs which provide some useful function or service, while secretly doing something else. The something else may be installing a virus, sabotaging some part of a disk, setting up hooks to steal passwords on time sharing systems, or whatever else you can imagine. In the event of the virus installer, the trojan horse has a bit more flexibility than a typical boot sector virus, simply because it doesn't have to fit itself into a relatively small space. Since it is hiding in a larger program, it can be whatever size is necessary to accomplish the task.

A typical boot sector contains information about the layout of the disk it resides upon. This block of data requires 26 bytes. The first three bytes of the boot sector are left available for an assembly language "jump" command, to allow the execution of the code to skip over the boot sector's data block. And, the boot sector must add up to the proper magic number to have executable status. That will require another two bytes, since the checksum is a 16 bit value. So, 31 bytes are allocated. Since (at least in the 68000 family) machine instructions are always 16 bits and must begin on an even address, 32 of the 512 bytes in the boot sector are not available to any executable program. So, there are 480 bytes available for the executable code. Machine instructions vary in length, depending upon what they do, and how much additional information is required. In the 68000, instruction lengths vary from one to five words, but a reasonable average instruction length for a program is just over two words. That translates the 480 bytes to 120 instructions.

The virus must contain the code to install itself, reserve the memory it occupies to keep subsequent programs from over-writing it, spread itself to other disks, and whatever it really intends to do once it decides it is time to act. That's quite a bit of code to fit into 120 instructions, unless it extends itself by loading some other part of the disk, or a file.

Files are pretty much out of the question. Most computer users would notice if some file they didn't recognize started popping up on a lot of their disks. There are attributes settable in a disk directory which can be used to tell the operating system that certain files are "Hidden" or "System" files. If the file had the proper status bits set, it could prevent itself from appearing in normal disk directory displays. There are, however, more flexible disk directory listing programs which will display the entries for these files, as well as normal files. There is also the problem of the space the hidden file occupies, as well as the directory entry. The space available on the disk will be less than it should be, since the hidden file is present. These symptoms would not escape detection for long.

A more effective method is the use of specific disk sectors. The standard disk layout covered in the preceeding chapter mentioned such things as File Allocation Tables, and disk directory space. In a standard format Atari disk, for example, each FAT is 5 sectors long, and the directory is 7 sectors long. That is more than enough FAT space to accomodate the entire disk. A virus in need of more space than 480 bytes might write the remainder of itself in the last sector of the FAT (I have one that does this). It might also write itself in the last sector of the directory, taking advantage of a quirk in the operating system.

When a disk is formatted, all data sectors are normally filled with a pre-defined value, E5 (hexadecimal). The directory and FAT space is usually set to 00. When a directory entry is made active, the file name is written in the directory, along with some other required information. When a file is deleted, the first byte of the directory entry is set to E5. That makes the entry available again. This is a carry over from the early days of floppy disks, when where the directory would exist on a disk was not as well defined. The directory entries had to appear as empty on a freshly formatted disk, so E5 was used as a deleted entry mark. That way, no matter where the directory was, a freshly formatted disk would always appear as empty. Now, since disk formats are more flexible, the directory is located by parameters, and normally the entire directory space is zeroed at formatting time. Since an active entry will have some legitimate ASCII character in the beginning of the file name, and a deleted entry will have E5 in the first byte, it is generally assumed that encountering a directory entry with a value of 00 in the first byte indicates that the entry has never been used. Since directory entries are used (and deleted ones re-used) on a first-found basis, finding one with 00 means that not only has it not been used, but none of the ones following it will have been used either. Consequently, most software stops looking at the directory entries when a 00 entry pops up. If there are several more sectors available, there may be something hiding out there, beyond the last used entry. While this method of hiding is not foolproof, the typical virus is not concerned about being bulletproof in all cases. It just has to survive long enough to reproduce itself, and it has half the battle won. As long as it keeps spreading, sooner or later it will survive long enough to do the task it is designed to do, then it wins both halves of the battle.

There are other ways for the virus to get additional disk space. Typically, floppy disks are not used up a sector at a time, but rather in groups of

sectors. Each group of sectors is referred to as a data "cluster". The number of sectors in a cluster is variable, and is one of the parameters stored in the boot sector. If the number of data sectors on the entire disk, minus the boot sector, FATs, and directory, is not an exact multiple of the number of sectors in a data cluster, the remaining sectors will never be used by the opearting system. A clever virus can find them and hide there. The inconvenience of this is that the unused sectors would normally be at the end of the last track of the disk, causing long (and noticeable) disk seeks to load or spread the virus.

There is a parameter in the boot sector designed to permit the disk to have sectors reserved for any purpose, and not accessed as part of the normal data area. A virus could also use this method to extend itself, but it, too, has shortcomings. Using this feature requires the parameter to be set when the disk has absolutely no data on it. Reserving sectors causes the start of the data area to be moved further into the disk. While the data area would be moved, the data already on the disk would not. Consequently, altering the reserved sectors parameter would make all files on the disk garbage. (They could be returned to proper status by restoring the original value to the reserved sectors parameter, providing no disk write had occurred.) There would also be the problem of the disk's free space being less that it should.

Consequently, if a virus needs extra space, using prescribed system features or hidden files is not a good choice, since it is too easily detected. The approach used so far is to hide in sectors unlikely to be used, and hope to spread before they get clobbered (and it works).

OK, so now the virus has managed to get onto a disk in your library, and then get itself booted into your system at startup or reset. It may have been on a disk you received from someone, and booted with, or it may even have been installed by a trojan horse, but it is in your system. How does it spread?

There are ways, and then there ways.....

The most common method is through the vector reserved for floppy disk read and write functions. As we saw in Chapter 1, floppy disks get changed (some surprise, eh?). One disk is removed, and another is inserted. When that happens, the operating system is notified by the physical act of changing the disk that the event has occurred. How that event is detected will vary with different disk drives, but there are two common methods. One is the disk drive latch. Some hardware reports the transition of the latch on the floppy disk drive's door. When the locking lever is moved, a signal is sent to the disk controller card, indicating that the disk door has been opened. (Door is a carry over term from older drive mechanisms which had fully closing doors over the disk drive slot.) The operating system makes note of the fact that a disk change may have occurred.

The other method is the write protect notch. On both 5 1/4 and 3 1/2 inch disks, the write protect notch tab is located in a position which makes it impossible to fully remove and install a disk without having the write

protect detection mechanism be fully obstructed at some point, and fully unobstructed at some point. The detection mechanism may be a physical sense switch, or an optical sensor. Either way, as the body of the disk is removed from the drive, it will be blocked. Then, when the disk is out, the sense area is open. So, the drive will report transitions on the status line. The operating system notes the change, and sets the necessary flags to indicate that the disk may not be the same one that was there a little while ago. It may also be, if the same disk was re-inserted, but that's not important. The fact that it may have changed is very important. Attempting to read or write to the disk, without first noting the characteristics of it, could be very destructive.

When the next access of the (possibly) changed disk occurs, the operating system will read the boot sector. In MS-DOS systems, I believe that the operating system assumes that if there is a possiblity that the disk has changed, it assumes that it has, dumps all information relative to the old disk, and starts fresh. In the Atari, the operating attempts to be a bit smarter. The boot sector contains a serial number which is supposed to be unique across all disks. This serial number is 12 bits long, and is assigned when the disk is formatted. If there is a possibility that the disk has changed, the operating system reads the serial number. If the serial number is different than before, the disk has changed, all old data is wiped out, and the new serial number is noted. If the serial number is the same, the disk has presumably not changed, and the data in the operating system's internal buffers is assumed to be valid. This leads to thoroughly trashed disks if two disks have identical serial numbers, and are used consecutively.

In any event, when a possible disk change has occurred, the boot sector is always read to determine the characteristics of the new disk. The operating system uses the floppy disk read function to access the first sector on the disk. As previously noted, this disk read function is pointed to by a vector. If the vector has been altered to point to a virus, the plot thickens...

We will assume a typical floppy disk boot sector virus for a while, and see exactly what happens. The virus first checks the number of the drive being accessed. If it is not a floppy disk, it passes the call on to the address it found in the vector. No harm done.

If the call is to a floppy disk, most viruses check the side, track, and sector of the call to see if it is the boot sector. If it isn't, it passes the call on, and again, no harm done. Why? Performance. Not that the virus cares about good disk performance, mind you. What it cares about is being noticed. If it was busy snagging all the disk calls, and checking the boot sector all the time, there would be an incredible increase in disk head seeking, and a very noticeable drop in performance of the system. Anyone with at least half a brain (witch inkluds sum smarter komputer pepel) would notice that, and would become inquisitive about what was happenning. The virus would have given itself away. No self-respecting virus would want to be detected before it got a chance to spread, and possibly wreak a bit of

havoc, so it remains inactive until it can accomplish its task unnoticed.

When the read call is to the boot sector, the virus goes into action. The data is read into a buffer, as designated by the host operating system's call, exactly as expected. Normally, the disk read function would return to the operating system at this point, but the virus doesn't. Depending upon the sophistication of the virus, several things may happen. Some viruses will first check the image of the boot sector in the buffer, to see if they are already on the disk. If they find the disk already has the virus, the go back to sleep (pleased, we assume!). Some even check revision levels in the virus image, and replace themselves if the disk had a more recent version of themselves!

If the image from the boot sector is not the virus, some will check to see if the image was of an executable boot. If it was, the virus does not alter it. Doing so would make a self-booting disk fail forever after, and would probably lead to the detection of the virus. Other viruses, not as sophisticated, will not execute this test, and may be spotted more readily.

Now, assuming that the boot sector is not executable, or that it is but this virus is too dumb to leave it alone, it's time for the virus to spread. There is a copy of the boot sector from the original virus disk in a reserved memory area, from the original boot up process. The executing copy of the virus knows where that is, since it reserved the memory for itself and the image at the same time. The characteristics of the disk the virus came from may not be the same as the disk in the machine now. Depending upon the operating system's standards, the virus will either copy the disk parameter information from the current disk into its own image buffer, or copy its image into the current disk's buffer, leaving the disk's parameters unchanged. Either way, the result is a copy of the current disk's parameters, combined with the executable image of the virus. Now, the executable status checksum must be computed, and added to the buffer. This may be accomplished by a routine in the virus, or by an operating system call. If the virus is on an Atari, it might be careful enough to insure that the serial number on the new disk remains the same. Failing to do so would lead to all disks with the virus having the same serial number. That would lead to disks being accidently altered (due to the serial number test), and the virus would probably be detected too soon.

When the new checksum is completed, the updated boot sector is re-written to the disk. All this occurs in much less than the time required for the floppy disk to make a single revolution, so the boot sector is re-written on the next spin. Since the rotation speed of the disk is either 300 or 360 rpms, the total time lost is less than 1/5 of one second. Nearly impossible for anyone to notice, when combined with the time required for the drive to load the head, seek to track zero, read the sector, etc.

The only potential problem here is one of the virus' intended victim's primary levels of defense: the write protect feature. Despite rumors to the contrary, I have not seen a virus capable of writing to a write protected disk. The hardware in the disk drive will not write if the write protect status is set. It reports an error to the operating system. The virus can

not override this protection, but it must be wary of it. Older viruses were sometimes spotted when a system error occurred, reporting that an attempt was being made to write to a disk which was write protected. If the function being performed (listing a directory, for example) should not be writing to the disk, there was reason to become suspect. Most viruses now are more sophisticated. They take over the error vector before attempting the write, and restore it afterwards. That way, if the attempt to spread themselves to the new disk fails, the error never gets reported. While the user doesn't know that the attempt was ever made, the disk also doesn't get infected.

Many viruses run counters. Some count the number of already infected disks they have seen, while others count the number of disks they infect. Either way, the counting viruses have some threshold they are attempting to reach. When they reach that number, they (presumably) consider themselves thoroughly spread, and it is now time to start their third act.

End of Chapter 2.

278. Hard Disk Partitioning Tutorial

Newsgroup: comp.sys.atari.st
Date: 1989-03-06 14:30:18 UTC
From: hcj@lzaz.ATT.COM
Message-ID: <457@lzaz.ATT.COM>
Source record: 249650
Cross-posted to: comp.sys.atari.st,comp.os.minix

This is meant to be a tutorial on partitioning a hard disk connected
to an Atari ST computer. It will address TOS, Minix, PC-Ditto, and
Spectre 128 usage.

There is considerable mysticism about the partitioning hard disks for
the Atari. It isn't as complicated as it may appear.

OVERVIEW

A hard disk is just a collection of sectors, numbered 0 to MAX, where
MAX is the total good sectors on a given hard disk. Within most of the
disk interfaces is an Adaptec 4000 controller. When told which sectors
are bad this device automatically squeezes them out, leaving MAX-N good
sectors.

Rule one: Always subtract a reasonably small (128) number from the total
size of the disk to allow for this shrinkage.

PARTITIONS

Partitioning is just a way of thinking of the whole disk in parts. It
occures in UNIX and MS-DOS because the original files systems could not
exceed numbers which were small compared to the total disk. The most
current limit is TOS, which cannot handle a file system larger than
16 megabytes (32767 sectors of 512 bytes each).

Sector 0 of the hard disk holds three kinds of information. Within a
total of 512 bytes there exists: First, an area reserved for a boot program.
Second, sixteen bytes to describe the physical parameters of the disk; and
ten bytes to support bad sectoring. Third, an array of four partitions.
Each entry in this array describe the partitions storage area on the disk.

This is the 'C' description of a partion:

```
/*
* Partition information (part of sector 0)
*/
struct pi {
char pi_flag; /* active byte */
char pi_id[3]; /* partition id (GEM or MIX(?)) */
long pi_start; /* first sector */
long pi_size; /* total number of sectors */
};
```

If a partition is allocated, the flag is set to '1', and the size is set
to the actual size of the partition is sectors. Usually both the flag and

size will be 0 when a partition is unused. Start is the actual physical sector of the hard disk where this partition begins. Within the partition we talk of logical sector numbers from 0 to size -1. Additionally the partition may have a name (ID) to descibe who might expect to use it.

It is not uncommon to find several different names in the partitions, to indicate that each different name is organized logically different from the other.
Some examples of this:
A. TOS and PC-Ditto can process partions containing MS-DOS file systems. They use the ID 'GEM' to indicate this. When they boot, only the 'GEM' partitions are given ICONs on the desktop. Intervening partitions of other types are ignored. Thus the First GEM partition is called C:, the Second GEM partition is called D:, etc.
B. Spectre 128 and Magic Sac store Macintosh file systems on the hard disk. They are given a uniq ID of (ACK) so that they will not be used by TOS since they are not organized like a MS-DOS file system. Only the partitions with an ID of (ACK) are availiable to be mounted when the Macintosh emulator is running. Again they are numbered from first to last, and need not be adjacent. These partitions use both 1 and -1 as the active flag.
C. Minix, is a UNIX feel alike, and utilizes yet another file system organization. It does not label its partitions, but they should have an ID of 'MIX'. Minix, in the tradition of UNIX, allows all partitions to be accessed, although its only sensible to mount as a filesystem one known to belong to Minix. This allows great flexibility to Minix, for it is then possible to write a program to access a different area of the disk (different partition), and interpret its blocks according to the rules of its own file system. The 'tos' program in Minix does this to allow it to read and write files to and from GEM partitions.

FORMATTING

To physically format and partition the hard disk requires interaction with the formatter and file system builder (vendor supplied), the hard disk driver for TOS (vendor supplied) and TOS's demands on the disk (Atari supplied).
- TOS expects that there is a file system name GEM
and that it is no larger than the 16 Meg maximum TOS can handle.
- The driver expects to find 4 or 12 potential partitions, and stores the starting address and size for each GEM partition. These stored quantities are accessed by refering to them as logical drives (C:,D:, etc).
- The formatter and file system builder are usually supplied a one program called a formatter. The true formatter function issues one command to the Adaptec 4000, who in tern formats the drive. A good formatter will also allow entering a list of bad areas on the disk, which can also be input to the Adaptec 4000.
- The file system builder wants to 1) establish the size of a partition and 2) fill up the partition with a GEM file system. These are really two separate acts. This is the only component of the whole system that links

these two concepts.

The important thing to remember here is that a partition may be much larger
than the file system in it. Consider a 100 MB disk with 4 GEM partitions.
If we try to get the most disk usage:
A. Partition 1, 16 mb, ID=GEM, logical drive C: start=0x1 size=0xfffe
B. Partition 2, 16 mb, ID=GEM, logical drive D: start=0x10000 size=0xfffe
C. Partition 3, 16 mb, ID=GEM, logical drive E: start=0x20000 size=0xfffe
D. Partition 4, 16 mb, ID=GEM, logical drive F: start=0x30000 size=0xfffe

What about the area on the disk that starts at 0x40000 that continues to
the end of the disk? Its not being used. If there were a way to describe
a fifth partition, it could start there. This is what the Supra partitioning
scheem does. It adds 8 more partition slots in a separate array. Please
realize that the space is available on the disk with or without the slots.
While Spectre 128 and PC-Ditto are Binary distributions there is little
one can do to use an area of the disk that does not follow the Supra scheme.
But Minix, for example, is a Source distribution, and its hard disk driver
can be modified to utilize the remaining space any way the author wishes.
Consider what happens if:
- Minix slice 6 starts after partition 4, of size 512 blocks. We have a nice
Root partion.
- Minix slice 7 starts after slice 6. The whole rest of the disk is available
as a Minix file system.

SECTOR 0 of the HARD DISK

The Following is the way Sector 0 of the hard disk is organized:

```
struct hi {
char hi_gap1[0x156]; /* reserved */
union {
char hi_xgap1[0x60]; /* reserved */
struct pi hi_supra[8];
}
short hi_cc; /* number of cylinders */
char hi_dhc; /* number of heads */
char hi_gap2[1]; /* reserved */
short hi_rwcc; /* reduced write current cyl */
short hi_wpc; /* write-precompensation cyl */
char hi_lz; /* landing zone */
char hi_rt; /* seek rate code */
char hi_in; /* interleave factor */
char hi_spt; /* sectors per track */
long hd_size; /* size of disk in sectors */
struct pi hd_pi[NPARTS]; /* 4 partition descriptors */
long bsl_start; /* start of bad sector table */
long bsl_count; /* number of bad sectors */
short hi_magic; /* reserved for checksum */
};
```

SUPRA PARTITIONING

The Supra partitioning scheme has become a defacto standard. It adds
8 partitions to the 4 original ones, by taking 0x60 bytes from the end
of the boot area and allocating a array of 8 more partitions. Supra
also supplies a hard disk boot program that will run in the reduced
space.

LOGICAL SECTOR 0

It is well here to emphasize the difference between sector 0 of a hard disk,
and sector 0 of a partition. When a MS-DOS file system occupies a partition
its first sector is also called the boot sector (of the file system). This
sector describes the structure of the rest of the file system. Utilities
such as memfile display only partitions, and sector 0 is that of the partition
not the hard disk. Using TOS, the only way to display sector 0 of a
hard disk is with a specially written program to address the disk directly.
The Abacus books contain a sample program that works. In MINIX, /dev/rhd0
accesses sector 0; so 'od -x /dev/rhd0' can be used to display the
information.

When Magic Sac first came out with hard diks support it was found that TOS
seemed to have a boundary problem, and if it wrote on the last sector it
seemed to damage the Magic area on the disk. While I will not comment on
this, both Magic/Spectre and Minix, worry about this situation.

PANDORA is a BBS and THE BOX is a FIDONET compatible mailer program.
You should be able to download them from good FIDO BBS.
It's nothing to do with ordinary networking.
The FIDONET is similar to the usenet but run by hobbyists all over the world
mostly on MeSsyDOS and recently some Atari systems to exchange message areas
(equivalent to newsgroups) and netmail bitween BBS.
If you can't get them anywhere and you are still interested send mail and
I'll try to find a way.

280. atariST TOS gcc V1.34 avail for FTP

Newsgroup: comp.sys.atari.st
Date: 1989-03-06 14:59:51 UTC
From: bammi@dsrgsun.ces.cwru.edu
Message-ID: <563@cwjcc.CWRU.Edu>
Source record: 249552

A new distribution of TOS atariST gcc and associated
libraries and tools are available for anonymous FTP from dsrgsun.ces.cwru.edu
[129.22.16.2], directory ~ftp/pub/atari (cd to pub/atari).

Features:
- update compiler to gcc V1.34
- update assembler to gas V1.31
- update gcc-ar, gcc-ld
- several fixes to library and support files.
- a few new utilities (cnm, fixstk, printstk).
- lots of your suggestions/comments incorporated.
- better floating point support.
- slightly improved portable math library.
- binaries/lib objects included in distribution for your convenience.

Originally it only works with EPSON compatible printers but there are drivers
e.g. for the NEC P6/7 which are run from the AUTO folder as far as I know.
Hope this helps

On Feb 24th Steven Grimm posted the prg 'keyfix' to comp.binaries.atari.st,
the source should have been posted to the sources group.
It can be run on the gulam.prg and makes a gulamnew.prg for your keyboard.

Hello All,

I recently purchased a copy of BBS version 2.1 for my 520STFM, in the hope that I would be able to set up a simple board which would allow the downloading of files and some sort of mailing system for the users only to find that it contains some bugs.

So I have now decided to write my own. This will involve finding out how kermit works, and any other file transfer protocal methods such as XMODEM, etc. so that users can download files from my machine to their own. I also intend to use the Midi ports on the 520STFM for a local area network which will enable me to connect a Mega ST 4 and another 520STFM for local users.

Any info on kermit, midi, or other BBS packages which run on the ST will be greatfully welcome.

Regards,

Jason.

>> to the laser printer...
>> --Kenneth Soohoo (soohoo@cory.Berkeley.Edu)
>
> How does a program do this? Presumably terminate-and-stay-resident, but how
> does it intercept keypresses?

You don't have to intercept the keypress data. There is a
documented low memory vector to the screen dump routine. All you need
to do is take over that vector, whenever the user presses Alt-HELP your
code will be run. Check the "Hitch Hiker's Guide to the BIOS", it has
the official list of low memory vectors and variables.

> Steve J.
>
> From: att!chinet!saj@ucbvax.Berkeley.EDU (Stephen Jacobs)
>
I think he's got it right. I do have this SEDT, both as GEM and TTP program.
And indeed it is a very nice tool, especially when you are used to DECs
EDT. I tried to reach Steve Jacobs, but ...

I would be willing to mail SEDT to a file server. But somebody has to tell
me how to do this from BITNET/EARN. Would it be allright to use ARC 5.21b
(from SSYX) for archiving, or does this have the same problems as the original
ARC 5.21?

I think the best idea would be to mail three archives:
1) The manual (which I have to dig up somewhere)
2) SEDT.TTP and related files
3) GSEDT.PRG and related files

The versions I have are 3.3 for the programs and 3.2 for the manuals.
If somebody has a newer version, please let me now.

No, no, I am not going to mail it to 200 different persons.

287. Re: Atari ST mouse: is there an alternative?

Newsgroup: comp.sys.atari.st
Date: 1989-03-06 17:07:21 UTC
From: VBRANDT@DBNUAMA1.BITNET
Message-ID: <8903061707.AA18570@ucbvax.Berkeley.EDU>
Source record: 249559

In Info-Atari16 Digest V89 #44, Lee J. Dickey writes: :

>I had a 1040 ST for about two years, and had no trouble to speak of with
>any aspect of hardware. In November, I traded up to a Mega ST2. As
>many of you know, I like to use Gulam and prefer using keystrokes to
>using the mouse, so my mouse does not get a lot of wear.

Same here (except that I upgraded in July '88, and to a Mega 4).

>... noticed that the arrow liked to go to the right but not to the left. I
>did what I had done several times before with the mouse on the 1040,
>clean the lint from the ball and the rollers. I even took off the cover
>and cleaned the rollers and disk from above.

Well, my arrow didn't like to go up or down. This problem came and went.
I, too, opened and thoroughly cleaned the beast.

>But this time the problem persists. I have not mis-treated the cord,
>which lies slack on my desktop, so I doubt broken wires in this case.

Same here. Worse, sometimes the mouse arrow starts 'wandering' in little
(one-pixel) increments.

>Now, I am worried. Any other suggestions? Since this is a "one way"
>problem, I suspect a diode in the motion detection circuit inside the
>mouse. Any insight or suggestions would be appreciated.

Since my mouse sometimes moves on its own, I suspect the optical detector
(don't know the tech term, the thingie that sits behind the little wheel
opposite the light source :-).

Solution? I have no idea. Maybe some friendly EE can come up with a more
accurate description of how the mouse works (or even a part # to replace).

WARNING: FLAMES AND UNPROVEN ALLEGATIONS AHEAD

Strangely, Atari Germany offers a "DM 50 new mouse trade-in policy", whereas
normally they won't even sell motherboards. Maybe there are some mouse pro-
duction problems ????? Also, since they changed from the 'Japan mouse' to
the 'Taiwan mouse', quality has decreased drastically. After a year of regular
(ie daily but not excessive) use, the left mouse button usually fails. So this
is 'power without the price' ... maybe it's only Atari Germany behaving weird.
(Wouldn't be the first time ...)

Hello everyone! :

Is there someone on the net who plans to visit the CeBit Fair in Hannover, West Germany? I'm going on Thursday, March 9th. If there's interest for a meeting and trading of experiences, I'd be delighted.

Maybe we could gang up and pressure Atari into releasing TOS 1.4 :-)

Are any of the US Atari people attending (aside from Mr. Shivji) ?

There was some question about SEDT's status. I'd suggest you attempt
to contact SEDT's author Anker Berg-Sonne, at DEC. I don't know if
Anker reads this forum. And yes, SEDT is a very good editor, for EDT
throwbacks like me. :-)

Source record: 249567

This is a reply to a mail query I recieved regarding hooking into the system console input routines. Basically the question boiled down to: "How do I do something at the BIOS level before GEMDOS gets ahold of an input character?"

==========

As you may have guessed, GEMDOS gets all its character input by trapping into the BIOS. Not only that, but (thank goodness) the BIOS has a RAM based jump table for its* character IO, and it actually uses that jump table.

Starting at $51e, there are four sets of 8 vectors for character device functions, as follows:

```
*--- "soft" console vectors
xconstat: ds.l 8 ; (51e) console status vectors
xconin: ds.l 8 ; (53e) console input vectors
xcostat: ds.l 8 ; (55e) console output-status vectors
xconout: ds.l 8 ; (57e) console output vectors
```

Each set of vectors consists of the addresses of the routines that handle the BIOS character devices (in the following order):

```
0 - lst: (printer)
1 - aux: (rs232)
2 - con: (screen)
3 - midi
4 - keyboard (output only)
5 - raw console output (bypass vt52 pressure cooker)
6 - reserved
7 - reserved
```

and, as comments in the BIOS source indicate:

```
* No range checking is performed. If a bogus device number
* is passed to the BIOS' character I/O handler, the system
* will crash or become funky duex.
*
* BIG BUG: ikbd and midi output status are reversed. Sorry, kids.
* For compatibility, we won't fix it. (But we should!)
```

Armed with all that information, you should probably be able to do what you need at BIOS level by replacing the built-in input and input status routines with your own.

```

This is not so much about 'nullfilling' as strange startup
problems.
I have had your MT C-shell as well as the Micro C-shell for sometime
now. I have recently downloaded the Sozobon C stuff. The *.TTP
programs work under the Micro C-shell but not under MT C-shell.
Atfer some investigation it appears that the Sozobon startup uses
some interresting methods to find the name of the program that was
'pexec-ed'. I would like to know if this code uses standard things
'everyone knows' in the atari world or do I have an old version of
MT C-Shell or this is what I get for using 'free' stuff.

Thank You
John Clark

305. multi-sync monitors, LISP

Newsgroup: comp.sys.atari.st
Date: 1989-03-07 14:32:07 UTC
From: Forster%vax2@cs.umass.edu
Message-ID: <2814273127-3247389@Cousteau>
Source record: 249577

[I sent out two previous messages about this, but appear to have botched the address, so here goes again:]

Multi-sync monitors:
My mono monitor has given up the ghost (or at least become comatose), so I've decided to look into getting a multi-sync monitor instead. I've heard that the NEC Multisync-II and some Sony monitor will work, once the right wires have been plugged into the right places, but I've also been told to watch out, in case a monitor doesn't handle the signals the ST puts out. How many monitors are actually compatible with the ST. Does someone (hello, Atari?) have a list of monitors known to work with the ST? (hope, hope) In particular I'm looking at an economical model put out by Samsung under the Imtec label (sorry, no model number, just `multi-sync'), which may or may not be the same as its slightly higher-priced brother, the Samsung CN4551. Can anyone help on this, please?

LISP:
On another note, I asked about this here before (about a year ago), but the answer may have changed in the meantime. Does anyone know of a decent implementation of Common LISP for the ST? I've heard about Cambridge LISP (which is PSL, not Common, and therefore not as useful), XLISP, something from Robinson Engineering in the U.K., LeLisp, and something Sandra Loosemore (are you listening?) was working on a while ago. Has the status of any of these changed? Have new versions come out which I'm not aware of?

Sorry if either or both of these have come up recently in discussions. We've not received any ST netnews since the networm in November (or whenever).

Thanks in advance, David Forster

>MEGA ST2 with a revision-4 board or a 1040STf, but it crashes (with 4 bombs)
>on any MEGA ST2 with a revision-5 board.
>

We also have met a problem with our ADC/DAC cartridge,
but now also on some Atari 1040 STs.
(one Serial No. is A1840 3010343 M)
(the desktop says it is copyright 86,87)
(some - but not all - the power/disk LEDs are green/yellow)

We have a few different cartridge designs that have worked fine for some
months. A student has just wasted quite a bit of his project time as a
result of this change - by chance he was allocated one of a new batch of
1040 STs just purchased.

The ROM seems to be checking the cartridge for valid code, and then marking
cartridge address space as unused memory when no code is found there
- no further access to the cartridge can be made.

A further problem we have noticed is that gemstart
(i.e. for an autobooting Uniterm terminal) refuses
to run on these machines, presumably due to ROM changes.

310. Screen Dump & Color Monitors

Newsgroup: comp.sys.atari.st
Date: 1989-03-07 19:43:41 UTC
From: terrell@druhi.ATT.COM
Message-ID: <3966@druhi.ATT.COM>
Source record: 249582

Someone commented that the built in <ALT> + <HELP> screen dump does not work for color printers. In fact it does - but you need to have the screen colors set right or you get a printout that is the reverse of what you want (i.e. black where white should be, & vice versa).

I can tell you how I set the colors if you're interested.

My mouse was on the verge of giving up the ghost. I would have to click many times for it to recognize the click. I took it apart and squirt some 'tuner tonic' from Radio shack on the microswitches and it is as good as new. I bought my 520 st when they first came out, so my mousie is just wearing out, I think.

I have an Atari 520 ST (a very early model) with an A.E. Brown 1 meg
upgrade. I noticed that my mouse arrow 'wanders' with 2 programs.
For some reason, both programs were on partition F of my 20 meg Supra
hard drive. I thought it was a problem with memory. Does anyone out
there have any ideas on what causes the 'wandering mouse arrow' ? The
2 programs it happens in are: the demo version of Calamus and the
GFA Basic program from STart magazine.

Since I thought the 'wandering mouse' was a software bug, I dumped both
of those programs from my hard disk.

Well, you should always have all your equipment off when plugging or unplugging any sort of computer equipment.....just in case.....The monitor master box was intened to save the life-span of the monitor plug and the cords....

I have the monitor master at home and always leave the monitor off when not in use or switching with the M/M box.

If you have the color monitor too close to the mono, you will notice some disruption of the mono screen when the color monitor is on. This is due to both monitors producing a *VERY* strong magnetic source when powered up and the 60Hz color monitor is affecting the 70Hz mono.

315. STAR NX-2400 PRINTER AND FIRST WORD PLUS V. 2.02

Newsgroup: comp.sys.atari.st
Date: 1989-03-07 20:53:44 UTC
From: CHIASSA@UDEM.BITNET
Message-ID: <ID4730.D890307.T165344.CHIASSA@UDEM>
Source record: 249587

I just purchased an Star NX-2400 printer and am trying to configure the driver to give me the best graphic resolution with FIRST WORD PLUS. I can get it to work at 8-bit Single-density(60dpi) but this is far below what the printer is capable of doing. If you have managed to obtain a better resolution could you let me know what you used for the linefeed in printer units D (first line of the driver), pixels/inch (first line of the driver), and the start graphics command. If you known that 60dpi is the resolution limit imposed by the software I would also appreciate the message.

Many thanks

The only "problems" I've encountered is that the color monitor
will cause unbelieveable interference on the monochrome if both
are on at the same time.

But then again...my two monitors are about 3 mm apart ;-)

317. Floats in GCC v1.3x

Newsgroup: comp.sys.atari.st
Date: 1989-03-08 00:42:00 UTC
From: franco@iuvax.cs.indiana.edu
Message-ID: <36500063@iuvax>
Source record: 249589

Here is a question concerning floating point capability using gnu c-compiler v 1.34. I cannot seem to be able to get floats having value greater than 10^9 or less than 10^-9. For example, the program below gives erroneous results for z and c:

```
main()
{ double x,y,z,a,b,c;

x=1e5; y=1e8; z=1e12; a=1e-5; b=1e-8; c=1e-12;
printf("\n\n%le %le %le %le %le %le\n\n",x,y,z,a,b,c);
}
```

In fact, the output is not even in e format (but f format instead). The question is, am I doing something wrong (possibly an incorrect switch when compiling) or is there essentially no float support with the gcc so far ported to the atari? If floats are currently broken, is there a way that I might be able to fix them?

BTW I have tried several switch combos including ffloat-store, -DIEEE etc.

Email to franco@iuvax.cs.indiana.edu would be appreciated. Thanks.

Concerning the replacement of dead mouses, the latest info I have on the Atari exchange program is that they will exchange an ST mouse for $25.

Contact Atari Corp., Customer Relations Dept., 390 Carribean Dr., Sunnyvale, CA 94089

(There is a "Door #" to the address which I forget now, but it seems that mail to this address gets there anyway..)

This "Exchange Program" has been one of the few "shining stars" from Atari Corp. in recent years. If you have ANY dead Atari equipment, contact them FIRST.. before paying high repair or replacement prices (like from Federated gak!) This program would be even more remarkable if Atari would publicize its existance...

>work in combination with an ICD host adaptor and MFM drive?

NO! The Adaptec 4000A is a combination of the Adaptec 4000 and 4010
interface cards, according to the Adaptec 40xx series manual. You don't
want an Adaptec 4000 at all - either the 4000A or the 4070 will work fine.

324. Atari Sozobon C stuff and compatiblity clarification

Newsgroup: comp.sys.atari.st
Date: 1989-03-08 07:20:13 UTC
From: pa2183@sdcc15.ucsd.edu
Message-ID: <1280@sdcc15.ucsd.edu>
Source record: 249596

Recently I have been trying to get the Sozobon C stuff to
work under the Beckemeyer C-Shell products. Due to a
certain lack of clarity I am posting this follow-up item.

Ok so I flunked English 1-A. The "free" reference was to
the Sozobon Stuff.

Attached is the Sozobon argument initializer function
which performs some arcane things to determine what
was the name of the program that was run by the
parent task. My guess is that in the MT C-Shell
product, the TOS exec function is not called or not in
the way this code expects. So it crashs because the
pointer that is eventually found is NULL or in general
bad. Since the Sozobon folks made the linker they could
have embedded the program name into a standard variable
location and just picked that up if all else failed. At
least that's what the ancient DECUS C compiler did
in RT-11 an ancestor of TOS/DOS et al.

My "free" remark was directed towards this type of
debugging required, i.e. there's no free lunch!!

I am running Micro C-Shell 2.61 and MT C-Shell 1.10
which are not the latest versions available.

The book I know of that fits that description is:

"The Concise Atari ST 68000 Programmers Reference Guide"
by Katherine D. Peel
Published by Glentop Press.

It's a good reference. It's -not- a tutorial.

If you're looking for a copy, you can contact:

E. Arthur Brown Co.
3404 Pawnee Drive
Alexandria, Mn. 56308
Phone: (612)-762-8847

They sell them for $26.95 + postage. I got my copy from them in
less than two days and their catalog of ST and Amiga products alone
(which they include in any shipment) is worth the price of the phone
call.

328. FATAL TOS 1.4 ERROR!

Newsgroup: comp.sys.atari.st
Date: 1989-03-08 08:12:44 UTC
From: kbad@atari.UUCP
Message-ID: <1373@atari.UUCP>
Source record: 249600

(heh, I figured that title would get your attention... ;-)

When somebody showed me what ST Report had to say about TOS 1.4 in the latest issue, I just about fell out of my chair. Something about a "fatal hard disk error" that was corrected by Leonard Tramiel and myself.

For those of you who don't know who I am, my name is Ken Badertscher, and I'm a TOS software engineer at Atari. In fact, for the past six or eight months, I've been the guy who puts all the various parts of TOS together and burns the result into EPROMS for us to test here at Atari. I've also worked on many of the later enhancements that went into TOS 1.4, in the BIOS, Desktop and AES, primarily.

The last thing that was holding up approval for TOS 1.4's release to manufacturing a couple of weeks ago was a bug that bit Leonard Tramiel (VP of Software at Atari). Leonard had been running his system for quite some time with a hard disk that was literally on its last legs -- it had several* hardware problems, as well as media problems, but he had a lot of old stuff on it and never bothered to move it off to a different disk. It's too bad that he didn't, because a VERY OBSCURE bug in TOS reared its ugly head, and sent his hard disk data into oblivion.

Now before everyone starts to panic and think that TOS is going to thrash their hard disk, I want to make something very clear:

THE BUG IN QUESTION IS *VERY* RARE AND ONLY SHOWS UP IN EXTREMELY RARE CIRCUMSTANCES!

Now that I've made that perfectly clear, on with the story. Allan Pratt looked into the guts of GEMDOS, the part of TOS that handles files, and after a lot of looking, reconstructed the weird circumstances that caused Leonard to lose his hard disk data. Allan fixed the bug. In fact, this whole episode started back in December, and Allan fixed the bug in December. Leonard wasn't convinced that it had been tested thoroughly, however, so he was reluctant to proceed with releasing TOS until it had been tested thoroughly.

So, after weeks of writing test code, and trying to reconstruct the problem that happened to Leonard, and performing extensive autopsies on his hard disk, and running test programs for days at a time, I finally concluded that the bug was fixed. Not only that, but I cleared up another minor inconsistency in the way GEMDOS deals with deleting files. (Actually, I just discovered it; Allan finally upgraded the code).

In conclusion, I'd like you to all remember two very important points. NUMBER 1: The bug that bit Leonard has been around in GEMDOS since DAY ONE. If this were really a "FATAL ERROR" that could regularly cause

problems, IT WOULD HAVE BEEN FOUND AND CORRECTED A LONG TIME AGO, AND A LOT MORE PEOPLE WOULD HAVE REPORTED THE PROBLEM. In point of fact, it was a very unusual bug, and to his immense credit, Leonard is such a perfectionist that he would not allow TOS 1.4 to be released even with such a obscure, rare bug in it! NUMBER 2: ST Report reported that this bug was fixed in the FEBRUARY 24 version of TOS 1.4. In point of fact, the FEBRUARY 24 version of TOS does not exist. As you recall, I am currently the person at Atari who builds these things, and I never built a FEBRUARY 24 version. You can rest assured, however, that the FINAL RELEASE of TOS 1.4 will be as bug-free as we could possibly make it.

The moral of the story is:
Don't believe everything you read in the press!
--
Ken Badertscher | Hey, umm, the stuff I said up there
Atari R&D Software Engine | is, like, what _I_ think, okay?
{portal,ames,imagen}!atari!kbad | So, y'know, don't bug Atari about it.

329. Keyboard input

Newsgroup: comp.sys.atari.st
Date: 1989-03-08 08:45:43 UTC

Message-ID: <21306@agate.BERKELEY.EDU>
Source record: 249501

Do the Bconin and Bconstat functions lie?

```
while (c!='q') {
if (x=Bconstat(2)) c=Bconin(2);
printf("%d %c\n",x,c);
}
```

When I hold down a key, it starts with Bconstat=-1, which means a character is waiting, and then Bconin gets that character. After the key starts auto repeating, Bconstat starts to flip back to 0 sporadically (no character waiting). I let go of the key, and Bconstat goes to 0 (no key waiting), which is fine.
Then when I press 'q' to quit, and I see the keyboard buffer dumped out (into the Gulam shell). If I had put a getchar() after the loop, the keyboard buffer would be barfed out there. In any case, some keys were missed and just sat in the buffer.
Shouldn't Bconstat return -1 until they keyboard buffer is empty?

I'm asking this because I wrote a small game that used the keyboard. After a while of playing, the buffer would fill up, overwrite ram, and crash the machine (this is a known bug in the keyboard handler).

P.S. Are there better ways to get keys from the keyboard? i've tried evnt_multi(), and it does the same thing, no matter how long a delay I tell evnt_multi() to generate.

333. Re: Dealers? What Dealers?

Newsgroup: comp.sys.atari.st
Date: 1989-03-08 18:28:03 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <890308.12280299.007366@SFA.CP6>
Source record: 249505

Here in Central, East, and South East Texas, we have a good supply of
ST dealers. Excluding Federated, Fort Worth/Dallas has five dealers, Austin
has two, Houston has about five. Add to that the Federated chain.
The areas that hurt, though, are the rural parts. You find nothing
but Tandys, a few clones, and lots of Apples in the schools.

337. archive ftp addresses

Newsgroup: comp.sys.atari.st
Date: 1989-03-08 19:23:19 UTC
From: guy@dukempd.phy.duke.edu
Message-ID: <783@dukempd.phy.duke.edu>
Source record: 249509
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

Recently there was a burst of requests for addresses of archives
accessible to anonymous ftp.

In no particular order these are arpanet addresses of some places from which
I've gotten software or which maintain public archives for one of the
computers I use. This is the entire list so you'll have to cull atari
specific references yourself. I have connected to all of these at one time
or another, though, not recently for some of them. For those on
unix systems I'd remind you that sometimes there is a list of machine names
and their internet numbers in the file /etc/hosts.

An interesting non atari archive is expo.lcs.mit.edu. It has some 50 Mb of
bitmap pictures. They are in X11 format, but if someone were to write a
conversion routine, there would be plenty of stuff to use it with.

339. Format of 'bad sector list' of HDX 2.0 ?

Newsgroup: comp.sys.atari.st
Date: 1989-03-09 02:06:39 UTC
From: felner@inf.ethz.ch
Message-ID: <85@inf.ethz.ch>
Source record: 249511

I just added a new harddisk to my selfbuilt harddisk-kit. The disk has some hard errors on the media as indicated on the cover of the disk. To map them out, I formatted it with the HDX 2.0 from Atari, which has a Markbad facility that generates a bad sector list (BSL). However, it didn't find all hard errors, and after running 'Markbad' a few times, I got several different BSLs. Two entries at the end of the bootblock indicate the first sector and the number of contiguous sectors holding the BSL. The BSL looks like this (3 real examples):

000002 550000 002DC8 002D2C (2 bad sectors)

000003 AB0000 002DC8 002D2C 0003A6 (a 3rd bad sector)

000003 030000 00123F 002DC8 002D2C (different ordering and another bad sector)

It seems that the first entry indicates the number of bad sectors, and the third, forth, ... hold the number of the bad sectors. But what does the second entry mean ? Is it a checksum ? How to get it ???
Since this is the format used by Atari, I guess it will be 'official'.

If I know what the second entry means, I can build the BSL by hand, adding the bad sectors not found by the formatter (you never know !).

But how about handling that BSL. Does the TOS or any driver support it or even look at it ? Any comments ? Atari ?

Or even better: the format-command of the Adaptec 4000 controller supports adding a BSL, so that the bad sectors are mapped out at format-time. Doing so, you don't have to worry about them any more, because they are not accessible. Is there any formatter around that accepts such a BSL as parameter ?

BTW, how did you, netlanders, map out bad sectors before (or now) ? I was lucky not to have any bad sectors on my other harddisk so far.

- Tomas

Sorry to say but the 4000 and the 4000A are both MFM controllers. The Adaptec 4070 is the RLL controller. I'm using an Omti 3520 controller which is MFM and came as part of my ICD kit.

342. GDOS font format and more fonts questions

Newsgroup: comp.sys.atari.st
Date: 1989-03-09 04:35:31 UTC
From: clj@ksr.UUCP
Message-ID: <8903090435.AA21221@dudley-doright.ksr.com>
Source record: 249514

Can someone describe the GDOS font file format (a C header file would probably be great)? Unless I'm missing it in the documentation available to me (MWC 2.0.1, Sozobon C, Abacus GEM and Internals, and ProGEM), my only references to this documentation say to look in "the VDI manual", which I assume is part of the Atari developer's kit. (If I'm missing it, a pointer to read chapter such-and-such would do.)

Several random related points. What I'm trying to do is add characters to the font files shipped with Timeworks DTP. Since the characters I'm most interested in are Spanish alphabet characters, I don't think I'd have a problem contorting existing characters into the appropriate format given I knew what the format is. I'm correct, right, in believing these characters aren't available in the distributed fonts.

Also, I've seen references in STart and other places praising G+Plus. Does anyone have a quick review of this? I understand it's faster than GDOS (does it have higher quality (i.e. fewer bugs and/or increased performance)?), though I don't find GDOS's speed to be real annoying (I don't use a lot of graphics in DTP, which I understand is a big part of the problem). Also, how much should I want to get Fontz, given that increasing my supply of fonts is a desire, but I won't steal them (I have access to Macintoshes, so if there are good PD fonts available for them, that's a plus).

348. problems using joystick with ELITE(tm)

Newsgroup: comp.sys.atari.st
Date: 1989-03-09 15:26:13 UTC
From: dag@per2.UUCP
Message-ID: <830@per2.UUCP>
Source record: 249520

After seeing the game on a freind's ST, I went out and purchased a copy of "ELITE(tm)". I am having trouble using the joystick with it and want to know if this is a common problem:

When manuvering with the joystick, spurrious key events are being detected which are interpreted by ELITE as commands to launch, fire torpedes, jump into hyperspace, and several other things. This has happened with three different brands of joysticks.

This appears to me to be a problem with data overrun from the ikbd. It's my guess that the joystick packets are coming in faster than ELITE can respond to them and some characters from the packets are being lost. When the packet interpreter loses characters inside a packet, the first few characters from the next packet are used to complete the packet and the remaining characters from that packet are interpreted as key events.

The problem is such that I cannot play the game comfortably. I've only been able to dock successfully once, and that was using the keyboard.

What I would like to know is if anybody else has this problem. Also, is this due to the fact that I have a very early machine with an early IKBD? Is there a fix that does not cost $$$? I'm at work now, but I believe that this is a Rainbird product. Do they have a fix that reduces the joystick sampling rate to something that the program can keep up with?

349. Re: SM124 Diminishing Screen

Newsgroup: comp.sys.atari.st
Date: 1989-03-09 16:35:46 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <890309.10354523.009357@SFA.CP6>
Source record: 249521

A question was raised regarding the SM124's shifting of the screen to the right, SOMETIMES, and its being normal (centered properly) other times probably when the system is rebooted. I also get that here on my monitor. The problem seems that the 'picture' on the monitor is never in the same position per bootup. Allam Pratt summed up the fix with:

"No, it's not the ST hardware. It's good old analog electronics. Your screen's horizontal adjustment is off. To fix it you would have to open your monitor, and there are lots of nasties which can get you when you do. Have a TV type or dealer fix this for you. It's trivial, but you have to know where to look."

If only this was so. Adjusting the horizontal position of the picture is good for only THAT bootup. It will, alas, shift again during another bootup. The only real solution is to adjust, reboot, adjust and reboot again. Get the picture position in a good compromised location.
I'm really picky about this because I reside at a university where Macs rule. I run Spectre 128 and am frequently demoing the ST. I always want my SM124 to be at top shape. There's not anything that *I* can do about the shifting, but averaging the postion seems to help.

350. Splitting shell archives (shars)

Newsgroup: comp.sys.atari.st
Date: 1989-03-09 17:15:55 UTC
From: saj@chinet.chi.il.us
Message-ID: <7897@chinet.chi.il.us>
Source record: 249522
Cross-posted to: comp.sys.atari.st,comp.binaries.ibm.pc.d

A MicroEMACS macro for splitting shell archives (shar files) has lately been posted to comp.sources.misc. It has some advantages for users of systems which have different filename conventions than the system the shell archive originated on. The files are put into buffers, to be saved as the user pleases.

The macro works on most recent shars that were generated automatically, and is appropriate for 3.9 generations of MicroEMACS. The changes needed for SOME of the shars it doesn't unpack are fairly obvious (but specialized for each case). I understand that the release of MicroEMACS 3.10, which will remove the need for some of the peculiarities of the macro, is imminent. Steve J.

351. Files at score.stanford.edu?

Spectre GCR will be shown at World of Atari but will not yet be for sale at that time. GCR is a hardware cartridge with a drive cable. The cart is chained into the drive chain and enables the internal and extrenal drives to read and write MAC disks DIRECTLY (out of box) at (get this) 1:1 Mac speed!! Its is also much more reliable than Translator and the entire Spectre GCR package will probably cost less then the Translator alone!

>option. Hitting 'PRINT', however, inevitably returns 2, 'CANCEL' defaults etc
>!!!.

Congratulations! You have found a genuine bug in GEMFAST -- probably not
the only one. It exists in GEMFAST 1.1, so I'm forwarding a bug report to
the author.

Don Farmer's GEMQ bindings do not have this bug.

By the way, when specifying the default button or when checking the
returned value, the buttons are numbered 1-2-3, etc., not 0-1-2, so beware
of that in the logic of your program. The 0 is reserved for "no default
button."

>The main text string is irksome, apparently not handling the text bounded
>by '|' properly. I'm sure these problems would have been noticed during
>testing, so where have I gone wrong. (The Megamax manual quotes that the text
>message can contain '4 lines of 32 characters each' and in the following line
>'5 lines of 32' characters. The DR GEM-AES manual states '5 lines of 40
>characters' the total not exceding 200 characters.)
>
> What did I, rather than GEMfast, do wrong?
>
> Andy Gray

When the AES figures out how big to draw the alert box, it considers the
text of the message and not the text of the buttons. You can force the
dialog to be wider by including spaces:
switch(form_alert(NO_DEFAULT,
"[1][Hello World][SHOW|PRINT|CANCEL]"))
and so on.

The Pollack & Weber book "Atari ST Application Programming" says there can
be four lines of 32 characters; Mark Williams' manual says five lines of
40. The final arbiter is the AES; see what works.

359. DESKTOP VE

Newsgroup: comp.sys.atari.st
Date: 1989-03-10 02:41:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8903100240.AA29743@ucbvax.Berkeley.EDU>
Source record: 249531

Recently I had a chance to run the CDC application Desktop VE on an ST
under Spectre 128. First, I could not reset the baud rate; the default of
1200 baud could not be changed from the menu options. Second, the system
hung when it entered the X.PC protocol on our NET.

I would love to be able to run DT/VE under Spectre because I have to switch
to NOS/VE on our CDC (NOS is going soon) and I have not got the time to learn
yet another OS. A 1040ST using DT/VE would be a bargain basement front end
to our CDC system and could probably result in the acquisition of a bunch
of STs.

Anyone have any ideas on how to work around the problems. Attached is a copy
of a message sent from CDC; seems they had to work around Mac bugs to get
DT/VE going in the first place.

*** for those who do not know, DT/VE becomes a front end for the CDC file
server and lets the Mac's icon/mouse/menu interface be the controller, i.e.
for basic NOS/VE use one just points and clicks; no VE commands to learn ***

To: 01696@AECLCR

If you manage to get Desktop/VE running on the ATARI, I'd like
to know, so that Control Data's Central Software Support group
can keep the information on file. I don't have much hope though...
We had to work around a number of bugs in various versions of
the Mac ROMs and system software, and I doubt that SPECTRE 128
exactly matches those bugs.

360. Replacement memcpy() for dLibs

Newsgroup: comp.sys.atari.st
Date: 1989-03-10 03:03:17 UTC
From: to_stdnet@stag.UUCP
Message-ID: <736@stag.UUCP>
Source record: 249532

From: thelake!steve@stag.UUCP (Steve Yelvington)

I'm posting the following on the behalf of David Brooks, who is having
some trouble with the postnews mechanism at his site.
-- Steve Yelvington

David Brooks Internet: BROOKS@CSSS-A.PRIME.COM
uucp: {mit-eddie,uunet}!csss-a.prime.com!brooks
-----8<---
The broken memcpy() in the version of Dlibs distributed with Sozobon C
will hurt xargs processing (and a few other routines). Replace it with
the following, which fixes several bugs...

```
* memcpy by David Brooks 1/23/89
*
* char *memcpy(dest, source, len)
* char *dest at 4(sp)
* char *source at 8(sp)
* unsigned int len at 12(sp)
*
* This is generally optimized around the commonest case (even alignment,
* more than 4 bytes) but the time savings and space cost are minimal.
* Also, we avoid using "btst #n,dn" because of a bug in the Sozobon
* assembler.

.text
.globl _memcpy
_memcpy:
lea 12(a7),a2 ; Point to argument list
move.w (a2),d2 ; d2 = len
move.l -(a2),a0 ; a0 = source
move.l -(a2),a1 ; a1 = dest
move.l a1,d0 ; d0 = dest, ready to return

move.l a0,d1 ; Check for odd/even alignment
add.w a1,d1 ; This is really eor.w on the lsb. Really.
asr.w #1,d1 ; Get lsb into C. If it's 1, alignment is off.
bcs memcpy8 ; Go do it slowly

move.l a0,d1 ; Check for initial odd byte
asr.w #1,d1 ; Get lsb
bcc memcpy1
subq.w #1,d2 ; Move initial byte
bcs memcpy6 ; (unless d2 was 0). We could use dbra here,
move.b (a0)+,(a1)+ ; but that would have been bigger.
memcpy1:
```

```
moveq.l #3,d1 ; Split into a longword count and remainder
and.w d2,d1
lsr.w #2,d2
bra memcpy3 ; Enter loop. Note d2 could equal 0.
memcpy2:
move.l (a0)+,(a1)+
memcpy3:
dbra d2,memcpy2

bra memcpy5 ; Enter final loop. Again d1 could equal 0.
memcpy4:
move.b (a0)+,(a1)+ ; Up to 3 trailing bytes
memcpy5:
dbra d1,memcpy4
memcpy6:
rts ; All done.

memcpy7:
move.b (a0)+,(a1)+ ; Handle the odd/even aligned case
memcpy8:
dbra d2,memcpy7
rts ; and exit normally

361. argv[0] and Sozobon C

Newsgroup: comp.sys.atari.st

> John Clark
> Internet: pa2183@sdcc15.ucsd.edu

The argv[0] work is done by dLibs, not by Sozobon's compiler.

They are not standard things that everybody knows; Dale Schumacher and John Stanley had to do some detective work to get the argv[0] information correctly filled out. Mark Williams C apparently leaves argv[0] empty; some other compilers on the ST fill in a bogus word such as ya.out.

Try:

```
#include <stdio.h>
main(argc, argv) int argc; char **argv;
{
printf("argv[0] = %s\n", argv[0]);
}
```

... and you'll get some interesting answers, depending on who wrote your C libraries. If you use dLibs, you get the real current name of the program, including the path (c:\cstuff\argv.tos, for example).

Problems with MT C-Shell are not peculiar to Sozobon C and/or dLibs; Mark Williams provides a conversion program to get MWC-compiled software running under the Beckemeyer product.

The argv[0] work is done by dLibs, not by Sozobon's compiler.

They are not standard things that everybody knows; Dale Schumacher and
John Stanley had to do some detective work to get the argv[0] information
correctly filled out. Mark Williams C apparently leaves argv[0] empty;
some other compilers on the ST fill in a bogus word such as ya.out.

Try:

#include <stdio.h>
main(argc, argv) int argc; char **argv;
{
printf("argv[0] = %s\n", argv[0]);
}

... and you'll get some interesting answers, depending on who wrote your
C libraries. If you use dLibs, you get the real current name of the
program, including the path (c:\cstuff\argv.tos, for example).
```

David Brooks suggests that you may have been bitten by a bug in memcpy().
His replacement for the function appears in the next message.

By the way, problems with MT C-Shell are not peculiar to Sozobon C and/or
dLibs; Mark Williams provides a conversion program to get MWC-compiled
software running under the Beckemeyer product.

362. TOS 1.4 vs NEODESK and UIS-II

Newsgroup: comp.sys.atari.st
Date: 1989-03-10 03:22:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8903100344.AA03075@ucbvax.Berkeley.EDU>
Source record: 249534

I have read a mess of specs on TOS 1.4. I also own NeoDesk 2.0 and the UIS-II.
Personally, with NeoDesk and the UIS I cannot see any reason to buy TOS 1.4.
Can someone give me an honest opinion on what advantages 1.4 would provide?

FOLDXXX.PRG fixes the folder limit
DISKFREE.PRG speeds up the slow FAT access
STARTGEM.PRG allows GEM codes to autoexecute
STARTUP.PRG allows system reconfig on boot (my start up screen says:
M=Mac I=IBM A=Atari
to run Spectre, PC_Ditto, GEM
NITE.PRG gives me a screen save
UIS_II.PRG has replaced my need for Crystal for DOS functions from in an appl.
NEODESK.PRG for a hard disk system is essential in my opinion.

(awards of merit should be given to UIS and NEODESK authors)

Why, pray tell, would I want TOS 1.4; my Mega 2 with a Megafile 20 blows away
80286/80287 machines for DTP (average print time from Timeworks DTP to an
SLM804 laser is 43 seconds; average print time from an AT to an HP laserjet
is > 7 minutes for programs like GEM Draw with lots of hash patterns!)

What will I miss out on if I do not get TOS 1.4? Anything?

363. Re: GDOS font format and more fonts questions

Newsgroup: comp.sys.atari.st
Date: 1989-03-10 05:14:42 UTC
From: clj@ksr.UUCP
Message-ID: <8903100514.AA22410@dudley-doright.ksr.com>
Source record: 249535

From: Chris Jones <clj>
Date: Wed, 08 Mar 89 23:35:31 EST

Can someone describe the GDOS font file format (a C header file would probably be great)? Unless I'm missing it in the documentation available to me (MWC 2.0.1, Sozobon C, Abacus GEM and Internals, and ProGEM), my only references to this documentation say to look in "the VDI manual", which I assume is part of the Atari developer's kit. (If I'm missing it, a pointer to read chapter such-and-such would do.)

(Replying to my own request). I found some help in the MWC linea.h file, but it doesn't look like I really have enough information from there to do what I want. Info on G+Plus and Fontz also still desired, thank-you.

>anyone tell me what causes this and/or how to avoid it? Thanks in
>advance.

I noticed the same effect when my 520ST+ at work got a SH205
harddisk. Whenever I switch on the SH205 before the ST the
effect appears. However, when I switch on the ST before the
harddisk everything looks as it should. So this is what I
am doing:

1. Switch on the ST
2. Wait until the desktop appears
3. Switch on harddisk and floppy
4. Press reset to boot from harddisk

On a ST with built-in floppy this procedure would require a
boot from floppy as you cannot switch it off separatly. Ok, the
whole thing takes a bit longer than a direct harddisk startup
but I couldn't stand that nasty monitor look for hours.

I've already sent off the source code for Unix to LJDickey, and I think
that he is working on a port. Shouldn't be a problem unless it uses
very unusual Unix libraries, but since I ported it from BSD to V several
years ago that is unlikely. I forget what the code looks like, but I
can make it available. Address requests to ...!dalcs!biomel!bill, not
to this address. But be a bit patient, OK?

NONONO!!
========

The Adaptek 4000a is an MFM controller card. The 4070 is RLL. I have
both boards, but I have never heard of an Adaptek 4000. I'm sure one
exists, perhaps it was an earlier version of the 4000a??

Both the 4000a and the 4070 work reliably with the ICD Host Adapter.
They also work fine with the ICD MIO board for the 8-bit (for anyone who
might be interested)..

370. Laser C bug? (diasterous)

Newsgroup: comp.sys.atari.st
Date: 1989-03-10 14:20:19 UTC
From: rjd@zaphod.cs.brown.edu
Message-ID: <1709@brunix.UUCP>
Source record: 249542

Well, I just installed the new version of Laser C and the
C Source Debugger. I think I have encountered a horrific
error, but I would like to check with you folks, first.

I make a call to rsrc_load() and give it the *complete* path
of the location of the resource file. When I run the
program, the drive A light comes on (weird enough as it
is, considering the resource file is on the hard disk), and the
program gets a 68000 exception error. When I return to the
desktop, *all* occurrances of my resource file *wherever they
exist on the hard disk* are gone. In addition, any file that
begins with the filename prefix that my resource file had are
gone also.

For instance, in my working directory, I had:
FRED.RSC
FRED.H (the include for the resource)
FRED.C (the C version of the RSC)
In a subdirectory, I duplicated these files for backup purposes.
My program gets to
rsrc_load("d:\workshop\fred.rsc");
I get the exception error, and when I come back, all files
that match FRED.* are gone from the hard disk.

Now, either I've hit some strange combination of code that
does a seek and destroy mission on the FAT, or I've been sipping
too much herbal tea while debugging.

Anyone out there encounter anything remotely like this?

Message-ID: <3867@druwy.ATT.COM>
Source record: 249543

in article <1271@cunixc.cc.columbia.edu>, willi@cunixc.cc.columbia.edu (Gary A Williams) says:
> Does anyone out there know what the deal is with Spectre GCR? Is it a
> hardware device or is it some sort of software trick?

The hardware in the ST (17xx series FDC) can only uses MFM encoded disks, the Mac uses GCR. The Mac also uses variable speed drives which spin at 300 to 600 RPM, the ST (and most other computers) use fix speed drives which spin at 300 RPM.

The Spectre GCR is a hardware device (an ST cartridge) that allows the ST to use GCR formatted disks. It also takes care of simulating the variable drive speed the Mac uses. The hardware does require a lot of custom software in order to work.

> Is is supposed to be any more reliable than the ill-fated Translator I?

The "Translator One(tm)" is a fairly reliable product. Very few of the problems people have are actually due to failures of the Translator. Most are caused by the large variations in the brands of floppy drives Atari has sold. Some of the drives Atari sells do not spin at the correct speed (300 RPM) and thus will not work with the Translator, others have electronics that prevent the data from a Mac disk from being read since it doesn't "look" right. STs also have a lot of noise on the floppy disk interface which can interfere with the GCR data on a Mac disk.

The Spectre GCR will remove most but not all of the limitations the Translator One had. It will not be as sensitive to variations in drive speed, or to problems caused by the noisy floppy interface Atari used. Drives with electronics that prevent Mac data from being read will still not work though. (NOTE: There is a simple fix for some of these drives, Gadgets by Small will announce details on that when the Spectre GCR is released.) The Spectre GCR will be much faster than the Translator since it won't be limited to the data rate of the MIDI ports. Reading and writing disks with the Spectre GCR will be just as fast as a real Mac.

From: uace0@uhnix2.uh.edu
Message-ID: <720@uhnix2.uh.edu>
Source record: 249544

DC-PORT will cost:

$199.95 for the cartridge and $29.95 for the three DC-PORT cables.
You can order directly from us, or contact MichTron, they will also be
selling the units and cable sets.

MichTron 3.0 is (I believe) $30 to upgrade from 2.1 to 3.0, otherwise
the retail price is $79.95.

Believe me, 3.0 is *GREAT* I have been playing around with the MCL
(MichTron Command Language) which the BBS runs, and I have implemented
E-Mail, F-Mail, Fortune, and Wheel of Fortune with it. I also plan on
doing some other online-type games with it. It is a very, very nice BBS
system, the best Ihave ever played with.

If you want a demo of what it all looks like, call (713)973-6665 or 973-6555

That is our clubs BBS, and it is shaping up very nicely.

Hello one and all,}i
I am in need of a command processor that can handle batch files andthe
error code levels that are passed back from a program.
(Ie if I run program A from the command processor I want to return an error
condition and branch on that error code to another batch file or another
within the same bacth file..
It also must be able to exit from its self unattended.
Pcommand will do this for me but it doesnt ve an exit routine that you
dont have to hit return with.
I used to use gulam but I forgot how to use gulam with error codes returned
from programs.
I know anyone running citadel (Or STadel) should be able to help
me out.
I KNOW gulam will work but it DOES take up alot of memory doesn't it?

If I could find something that will work I would appreciate it..
WEven just knowing how to use the error levels to branch to other commands
from gulam will work for now.

376. Kludge for GEMFAST users

From: andyc@hplsla.HP.COM
Message-ID: <5440015@hplsla.HP.COM>
Source record: 249550

```
|
|Also, I've seen references in STart and other places praising G+Plus. Does
|anyone have a quick review of this? I understand it's faster than GDOS (does
|it have higher quality (i.e. fewer bugs and/or increased performance)?), though
|I don't find GDOS's speed to be real annoying (I don't use a lot of graphics in
|DTP, which I understand is a big part of the problem).
|----------

I received my copy of G+Plus last night (along with LDW Power). I fired up
LDW Power with GDOS and it was pretty snappy re-displaying when paging and
scrolling. I installed G+Plus and it was noticeably faster. I put G+Plus into
"solid" mode and it was faster still - i.e. damn fast! My initial impression
is very favorable for both programs.

The curious thing is that LDW states that GDOS is necessary only for saving
spreadsheets and printing graphs. What's GDOS doing the rest time - getting
in the way?

G+Plus comes with a manual that might as well be called "All You Ever Wanted
to Know About GDOS But Were Afraid to Ask". As if that wasn't enough, there's
also a disk file that expounds further!

I'll be installing G+Plus on my Easy Draw disk next and that should prove
interesting!

I, too, am having the same problem. My local dealer suggested that the horror-
zontal hold was off. For me, it only happens occassionally, and a re-boot will
cure it. I am sure that the problem can be fixed if I had the horror-zontal
hold fixed - but that costs money and time....

380. bug in gcc V1.34 crt0.s -- fix included

Newsgroup: comp.sys.atari.st
Date: 1989-03-10 21:10:57 UTC
From: bammi@dsrgsun.ces.cwru.edu
Message-ID: <579@cwjcc.CWRU.Edu>
Source record: 249402

```
Thanks to eric smith who reported the following serious bug in
gcc V1.34 startup file (crt0.s):

i had tried to include a redirection for stderr to console, so that
gcc applications would not need a wrapper shell to run in by doing
a
Fforce(2,(short)Fdup(1))
in crt0.s. This works fine, until you try to redirect stdout from
a shell (like gulam)
a.out > foo
what happens is that stdout and stderr end up in foo (another exotic TOS
bug -- is this fixed in tos 1.4??)
Now if you try to run this program a second time:
- i get error code -61
- eric smith reported that some files got trashed
so depending on your setup, i suspect one of the two will happen.
Please apply the patch enclosed below that backs out these changes, and
recompile and install crt0.o in $GNULIB. Hopefully we will come up
with a better scheme for stderr soon:
--
*** crt0.s~ Fri Mar 10 16:00:34 1989
--- crt0.s Fri Mar 10 16:01:00 1989

Funny you should mention that :-], I'm in the middle of a major hard drive upgrade. Mine started when I replaced the Miniscribe 8438 in my Supra 30 meg drive with a Seagate 157R. Now I had an extra mech and needed a case, so I bought an ICD Fast style case that holds two drives! Once that arrives I'll send mail on the cabling. Word of warning though - you *need* a controller board that can handle two drives, I have an OMTI 3527 that does the trick.

From: clf3678@ultb.UUCP
Message-ID: <418@ultb.UUCP>
Source record: 249406

Why would you want TOS 1.4 instead of UIS or NeoDesk?

Because it is in ROM, and doesn't take up 300k like ALL the other hundreds of programs you need. If you have a Mega 2, memory concerns aren't as great as us folks with 520's and a meg upgrade.

I'd KILL to have TOS 1.4 in my machine to fix all the nasties I've got now. But I will never see it in my machine (assuming Atari's track record for upgrading older machines doesn't change).

That brings up an interesting point. Why doesn't Atari put out a daughterboard so that all of us who have older machines can enjoy 1.4? It only seems fair. We spent our money on Ataris just like you guys with the Mega 2, only we spent it a few years earlier. :^)

If the size of the program is too big for the 256k chips we use now, Atari could:

1) Put out a smaller version (if this is possible) to fit into our machines.
2) Write the ENTIRE thing in Assembly (as it should be) to conserve space and speed things up.

I'm not ragging on anybody/anything, but it just annoys the heck out of me that I can't get all these new things for the machine I prefer to own. Just be glad you have the POSSIBILITY of getting TOS 1.4!

>The Adaptek 4070 and 4070A are the RLL controllers.
>
>I THINK the A is just a revision of the older 4000/4070.

NO!!!!!!!!!!!!!!!!!!!!!!

Please, people, check your facts! This thread could result in a lot of people buying the wrong card. I quote from the Adaptec "ACB-4000 Series User's Manual":

"The ACB-4000A Controller ... supports SCSI features and controls two Winchester drives. The ACB-4000A also supports both hard-sectored and soft-sectored removable drives, as well as all ST506/412 type fixed drives. The ACB-4000A was previously known as two separate products, the ACB-4000 and the ACB-4010. It is fully compatible with these products."

The inescapable conclusion I come to after reading that is that the Adaptec 4000 (no 'A') is NOT complete, and that you would need the 4010 as well to get a working system. If this is wrong, someone with a 4000 (no 'A') should break their silence and put us straight about the differences. DO NOT BUY AN ADAPTEC 4000 unless you know how it differs from the 4000A, because the 4000A is the one people are running.

Buy an Adaptec 4000A for MFM and a 4070 for RLL; that *works* (I have the former sitting directly in front of me). There does not appear to have ever been an Adaptec 4070. This "I THINK" crap is just going to cause trouble; if you don't have it, BTFM or CTFM so that you can RTFM.

389. Metafont for ST

Newsgroup: comp.sys.atari.st
Date: 1989-03-11 19:21:31 UTC
From: lean@sbcs.sunysb.edu
Message-ID: <2338@sbcs.sunysb.edu>
Source record: 249411

I have received quite a lot of mail regarding the Metafont program
(and misc files) that was posted recently on comp.binaries.atari.st

I do not have the sources currently. I got them (everything) from
John Dunning who is the one that did the port. { THANKS, John !! }

Yes, I forgot to send Steve the definition files (.mf) for roman,
math, etc. I'll post them here in the next couple of days :)

Some asked about where the Epson and Atari modes are defined. I'm not
quite sure, but i think it's already pre-loaded in the program itself.
They worked just as advertised!

Generating the fonts takes about 15-30 minutes per font size/type.
Be warned - if you use DVIST, you can get carried away and use days' worth
of CPU time to generate lots of fonts for it. But they're worth it in the
end, though. Mag=2000 in DVIST is really cool !!

390. The incredible disappearing RSC file...

Newsgroup: comp.sys.atari.st
Date: 1989-03-11 20:39:02 UTC
From: rjd@cs.brown.edu
Message-ID: <1802@brunix.UUCP>
Source record: 249412

```
Well, for anyone that paid attention to my last posting, half
of the problem was solved. As I stated in my last posting, the
new version of Laser C seemed to selectively distroy all files
on my hard disk that started with the filename given in my
rsrc_load()
function.

I received a mail message from Ted Miller here at Brown University
that pointed out that I was at least partially brain dead. (Um,
those are my words, not Ted's...) It seems that in my excitement
about playing with Laser C, I left my mind on hold and forgot
to enter the '\\' character in the path name. (This also explains
why the Atari accessed drive A:, since the path was non-existant)
So, instead of
rsrc_load("e:\workshop\test.rsc");
I should have had:
rsrc_load("e:\\workshop\\test.rsc");

Ok, I make the change, and everything is fine. The problem is
solved, or is it?

Obviously, the above change gets me on my way, but my original
question is still there: why did the badly constructed string
cause rsrc_load() to go on a killing spree on my hard drive?

Any ideas anyone?

>anyone tell me what causes this and/or how to avoid it? Thanks in
>advance.

One of two things here. First, you could have a defective component in the horizontal sweep circuitry that gets a bit better as it warms up. One way to track down such beasties is with a can of "freeze mist" (assuming you want to fix it yourself).

Another thing that perhaps the horizontal centering control is near the edge of it's useful range. The way I adjusted mine was this:

Turn the horizontal centering control in one direction until you notice a bit of folding (characters getting squished). Back the control off 'til this just disappears. Note the position of the control. Now, turn it the other direction and watch for the same thing on the other side of the screen. Back the control off again and not its new position. Move the control exactly between these two points. If the resulting picture is not centered on the screen, then use the centering rings on the back of the yoke to correct it.

This adjustment should be done when the monitor is fully warmed up. If you do this adjustment, and the folding is still present when the monitor is cold, then you'll need to track down the defective component.

I can provide more details if you like; they're a bit tedious, so I hesitate to post them. Good luck!

392. Running IBM Software on an Atari ST with PC-Ditto

Newsgroup: comp.sys.atari.st
Date: 1989-03-11 21:36:55 UTC
From: arya@eros.Berkeley.EDU
Message-ID: <10966@pasteur.Berkeley.EDU>
Source record: 249414

I received a brochure from Gadgets by Small that mentions a product called PC-Ditto from Avante-Garde (I'm not positive of the name, I don't have the brochure with me right now) that allows an ST to run IBM Software. Supposedly this product can coexist with the Spectre 128, and with the aid of a piece of public domain software, allow selection of Mac, IBM, or Atari mode at boot-time.

Can anyone attest to the quality of the IBM emulation PC-Ditto provides? I'd also like to know the company's phone number and a rough estimate of its price, and how it "plugs" into an ST.

> some E-piano (Fender Rhodes) sounds.

Realistic piano sounds on the D50? HA HA HA HA HA HA WOO hee hee
hee....

Sorry, I guess by now you have realized that there really isn't a
credible piano in the D50 to save its life. There are some really
good Fender Rhodes patches around though. One of the thrid-party
vendors out there has a killer patch but I don't recall who. You can
probably whip one up by experimentation that will suit your needs.

The D50 has a lot of great pads, strings and some wild synth stuff but
only a half dozen or so acceptable realistic anythings.

396. Trak-Ball/Parsec Pixel Plus

Newsgroup: comp.sys.atari.st
Date: 1989-03-12 03:34:44 UTC
From: cstein@jarthur.Claremont.EDU
Message-ID: <462@jarthur.Claremont.EDU>
Source record: 249418

I just bought an Atari "Trak-Ball Controller" for my ST in hopes it would function as a mouse. It didn't. When I select Trak-Ball mode, everytime I move the ball either left or right, the mouse pointer moves left. When I move the ball either up or down, the mouse pointer moves down. The proportional speed does seem to work with the mouse pointer, though. I have not tried it in the joystick mode yet, but I would assume it does function like a joystick. Does anyone have any ideas on making it work?

I read last summer in _The Games Machine_, a British magazine, an article about a special graphics board which plugs into the cartridge port and gives your ST phenomenal graphics. It was called the Parsec Pixel Plus, and was being designed by Elmtech, I think. It had a resolution of 1024x1024 and would display 256 colors per raster line, and had a palette of 16 million colors. I think it also ran at a speed of 6.25 MIPS, and would work on all ST's. Has anyone else heard about this? Does anyone know what is happening with its development?

Thanks for any help.

Everything I have heard has said that Atari _is_ planning to make TOS 1.4
available to owners of existing machines. TOS 1.4 is a very different
animal than the 4/22/87 ROMs. The main point of 4/22 ROMs was the support
for the BLiTTER. TOS 1.4, on the other hand, is a significant upgrade even
without a blitter; it makes sense to make it available to everyone.

399. Finding menu state

Newsgroup: comp.sys.atari.st
Date: 1989-03-12 04:53:23 UTC
From: saj@chinet.chi.il.us
Message-ID: <7912@chinet.chi.il.us>
Source record: 249421

Another in my endless series of questions about obvious/obscure points of Atari ST programming. Is there a neat way for a program to tell whether a menu is dropped? I didn't think this would be an issue, because I thought that once a menu drops the main program should be suspended as long as the menu is down. Doesn't work that way. I don't really want the program I'm working on to update the screen while a menu selection is being made--- kinda the reverse of disabling menus while you do screen updates. I don't even have bright but unpleasant ideas on this one: best I've come up with is walk the rectangle list and see if the part the present application doesn't own looks like a menu. Not bright & not reliable. What's the right way?

From: Xorg@cup.portal.com
Message-ID: <15733@cup.portal.com>
Source record: 249425

Hi Manish, unlike Spectre 128, pc-ditto is not *yet* a hardware emulator. pc-ditto is strictly software emulator that does a great job emulating an XT albeit at about 50-80% IBM speed depending on the program being run. It costs $89 retail, about $65 mail order. Avant Garde's phone number is (904)-221-2904 9-5 EST.

There is more though! Scheduled for release at the World of Atari show in April is pc-ditto II, a HARDWARE and software emulator that will be more compatible and run at 100% XT speed! Avante Garde is offering current owners of pc-ditto and any new buyers a coupon for 50% off the hardware emulator when it is released! Now thats company support!

From: clf3678@ultb.UUCP
Message-ID: <424@ultb.UUCP>
Source record: 249426

Well if you have a Mega or a newer 1040, you have the 4/22/87 ROMS that Mark mentioned. BUT, what about the old 520s (like mine) and the older 1040 machines that have the ORIGINAL ROMS?

Sure, the Mega can have the new ROMS because it has the required sockets for them (2 sockets). BUT, my machine has the smaller-capacity 6 sockets, which don't support the 1 meg chips 1.4 will use. A daughterboard is required to interface the chips into the sockets I have now.

Now I know that Atari's attitude is changing quite a bit towards the better (something I really like to see). It will be interesting to see if it changes enough to put out this fantastic upgrade for ALL machines. I really don't care about the BLITTER, but 1.4 is almost a necessity (it fixes SO many things and speeds up others). I guess it's a "wait and see" game now.

About 12 hours after I asked how to tell if a menu is dropped I figured out a way to do it (although it takes some discipline to make it work). Test the states of the TITLE objects in the menu. As long as they're all set to normal before the menu is activated, they should stay that way unless a menu drops. I haven't tested this yet, and I still worry that clicking off the menu without making a selection might not reset the TITLE states.

With all of the good news about the renewed dealer support, I am sad to pass on news about a real JERK of a dealer. This fellow lost his dealership with Atari about three weeks ago, and has therefore been trying to cut his losses by advertising what he has to sell. In the bottom part of his advertisement in a local newspaper supplement, this appears:

Personal Computers recommends Amstrad or Amiga.

We want to help you move-up. Trade-ins are now accepted.

Bring us your outdated, unused, unsupported computers for cash-off...
We'll accept such makes as:

Timex Sinclair
TI 99/4s Vic 20
Atari Atari ST
Commodore 64/128

****

I think that this is very insulting. For anyone interested, this dealer is:

Personal Computers
Westown Plaza Mall
301 Oxford Street East
London, Ontario
Canada

{no postal code given in advertisement}

Area Code: 519
Phone Number: 432-8274 or 679-2953

409. Hard Disks

Newsgroup: comp.sys.atari.st
Date: 1989-03-12 22:16:34 UTC
From: c184-au@holden.Berkeley.EDU
Message-ID: <11000@pasteur.Berkeley.EDU>
Source record: 249431

There was a good article in STart by Dave Small a few years back about
how to attach two hard disk mechs to a currently functioning hard drive.
It works something like this :
One drive has to be logical unit 0, one drive has to be logical unit 1.
Set the jumpers/switches/whatever on the disk mechs in this manner.
Both drives are connected by a (non-twisted) 34 pin ribbon cable. The
cable runs from one drive mech to the next drive mech to the seagate->scsi
interface. The drive that is in the middle has its terminating resistor
removed. The one on the end doesn't : it is the terminating drive.
Each drive is connected by a 20 pin cable to the interface.
Logically selected drive 0 is connected to the interface's connection #0,
drive #1 goes to interface connection #1. Both drives need power, and
that's just about everything you need to know.
Some 34 pin cables have a 5-pin segment twisted around between two of
the connectors.. this is for swapping drive select signals -- in this
case I believe that both disk mechs should be set to logical unit 0.
(I use a non-twisted cable..)
I followed the article by Small in STart when I hooked up my system
and have had few troubles.

The system I use is a BMS ACSI-->SCSI interface, an adaptec 4070
SCSI-->ST506(RLL) interface, a Seagate 238R and a Seagate 277R.
This totals approximately 95 MB at a cost of around $1000.
The BMS board doesn't seem to have attracted much attention on this
Newsgroup discussion.. I recommend it, especially if you're in the
Berkeley area. When my hard disk died (my own fault), I took my
system to their shack and they kindly helped me out with data recovery.

No fancy sign off -

This is really a request to Atari. I had mailed a similar request a while back, but never got any reply.

Please make TOS ver M.N available as binary files (raw binary, intel/motorola hex whatever). Quite a few of us replaced roms with eproms. This will be really convenient for us, and a lot cheaper for both parties.

414. GEM Objects

Newsgroup: comp.sys.atari.st
Date: 1989-03-13 04:57:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8903130457.AA22507@ucbvax.Berkeley.EDU>
Source record: 249436

In playing around with GEM, I tried replacing the desktop (from within an application) with a Degas Elite picture by:

1. defining the picture as a BITBLK data structure

2. placing the BITBLK data structure into an object data structure where:

OB_TYPE=23 (G_IMAGE)
OB_SPEC=pointer to the BITBLK structure

The replacement worked OK, but in object redraws, the mode is transparent and I cannot see from my documentation how to get into the replace mode. Windows, accessory images, etc, leave ghosts on the new desktop.

If I use a GEM object like a G_BOX, the OB_SPEC lets me set either transparent or replace via the OBJECT COLOR; when I set replace, redraws eliminate the ghosting.

How would I set redraws to replace mode if I am using a G_IMAGE object spec? OBJC_DRAW does not have a parameter to set.

>available to owners of existing machines. TOS 1.4 is a very different

*** SARCASM ON ***

Yes Mark.

We've all heard this before.
I bought my 1040 about 2.5 year ago, expecting to be able to add a
blitter soon. Blitters are being delivered with Mega's already quite a
time, and despite the fact that Atari has promised the availability of
blitters to us old-timers, I still have to see one.

Same holds for 1.4. It is announced long long ago.
However I don't believe it before I see it.

Anyway, since my system uses tos less and less, I'll probably burn a few
roms to contain minix instead of tos, and keep a disk version for the
few programs I still use.....

*** SARCASM OFF **

Still a 1040 makes a nice piece of hardware, much better than those AT
boxes with segmentation and that kind of problems....

Hi there. I just purchased a Sheagate ST4096 80Meg full height hard drive,
and would like to know which hard dive kits are the best?

I have various questions about the kits:

1) Which kits support full height dives?
2) Which interface hardware is the best?
3) Which softare best supports an 80Meg drive? How many partitions are
allowed? Auto-bootable? Whats the maximum size of a partition? Is
it compatible with Minix or other OSs?
4) How large is the case? Does the fan make alot of noise?
5) Which Adaptec interface is the best for a MFM drive?
6) Which kit is the fastest? Which is the easist to put together?
7) What are the prices?

Please Email me directly. If anybody wants me to summarize, send me
Email.

Thanks in advance for any and all replies.
Greg Welych.

Correct (sort of) but misleading. Virus detecting inits such as Vaccine
work by intercepting certain resource manager calls. Unfortunately, they
can get in the way. Checksumming programs is fine, but it involves adding
checksums to each application or storing them in a central file; each is
vulnerable to viral action. Viruses can be reprogrammed to avoid these.

Additionally, when you talk about detect and REPAIR programs, small changes
in viruses will make them invisible and/or unrepairable until the program
is updated. This is because none of these programs want to take a chance of
"repairing" an uninfected version of "Whiz-bang-space-aliens v1.2" just
because it looks sort of like it is infected by a virus. We are extremely
specific in our check criteria in order to avoid this unfortunate consequence.

The operating system of the QL is QDOS, not Tripos.

To return to the article: I think porting software from a QL to an Amiga (or
vice versa) is about as difficult as porting software from UNIX to a QL :
Not to simple. The problem is that QDOS is a quite odd operating system; it
has calls which can do the job but with different calls then you should expect.
e.g. a stty() call on a window is not existent; one should use another call to
read in "raw" and "cooked" mode (no cbreak; signals doesn't exist on a QL).
Another major problem is the lack of any environment variables on the QL.

Ah, finding Ataris can be a difficult experience, however, I have had
a pleasant surprise recently. Our campus is packed wall to wall with Macs, PCs
and PSIIs. A rather sickening sight to Atarians. However, this past week I
discovered a room at the health center. It appears that the health center uses
STs. In a full count, it was about a dozen 1040s, 3 or 4 megas, a laser
printer, and an image scanner. It was a nice sight.

I am also a fond user of C-Lab Notator. Does everything indicated in the base note, and is amazingly bug-free. My only real complaint with it is that it has a really confused (and combined) notion of triplets and dotted notes. Oh, you can get it to do what you want, but it takes a little getting used to. All in all though, a great program.

> Performing a coldboot will then boot up an SH204.

Atari has started buying DMA chips from a new supplier. The new
DMA chips are not compatible with some older DMA host adpaters. So some
older third party hard drives and Atari SH204s won't work with the new
STs.

Not necessarily, since the Panasonic 1091 is Epson compatable (at least mine
is).

And by the way, the reason you're getting 3/4ths of the screen is probably
not due to 80 columns, but because the ST thinks you have 1250 dots across.
Try using the Control Panel to "Set Printer" to 960 dots, and see if that
improves the situation.

```

Date: 6 Mar 89 14:30:18 GMT
From: att!lzaz!hcj@ucbvax.Berkeley.EDU (HC Johnson)
Subject: Hard Disk Partitioning Tutorial
To: info-atari16@score.stanford.edu

This is meant to be a tutorial on partitioning a hard disk connected to an Atari ST computer. It will address TOS, Minix, PC-Ditto, and Spectre 128 usage.

There is considerable mysticism about the partitioning hard disks for the Atari. It isn't as complicated as it may appear.

OVERVIEW

A hard disk is just a collection of sectors, numbered 0 to MAX, where MAX is the total good sectors on a given hard disk. Within most of the disk interfaces is an Adaptec 4000 controller. When told which sectors are bad this device automatically squeezes them out, leaving MAX-N good sectors.

Rule one: Always subtract a reasonably small (128) number from the total size of the disk to allow for this shrinkage.

PARTITIONS

Partitioning is just a way of thinking of the whole disk in parts. It occures in UNIX and MS-DOS because the original files systems could not exceed numbers which were small compared to the total disk. The most current limit is TOS, which cannot handle a file system larger than 16 megabytes (32767 sectors of 512 bytes each).

Sector 0 of the hard disk holds three kinds of information. Within a total of 512 bytes there exists: First, an area reserved for a boot program. Second, sixteen bytes to describe the physical parameters of the disk; and ten bytes to support bad sectoring. Third, an array of four partitions. Each entry in this array describe the partitions storage area on the disk.

This is the 'C' description of a partion:

```
/*
* Partition information (part of sector 0)
*/
struct pi {
char pi_flag; /* active byte */
char pi_id[3]; /* partition id (GEM or MIX(?)) */
long pi_start; /* first sector */
long pi_size; /* total number of sectors */
};
```

If a partition is allocated, the flag is set to '1', and the size is set to the actual size of the partition is sectors. Usually both the flag and size will be 0 when a partition is unused. Start is the actual physical sector of the hard disk where this partition begins. Within the partition we talk of logical sector numbers from 0 to size -1. Additionally the partition may have a name (ID) to descibe who might expect to use it.

It is not uncommon to find several different names in the partitions, to indicate that each different name is organized logically different from the other.
Some examples of this:
A. TOS and PC-Ditto can process partions containing MS-DOS file systems. They use the ID 'GEM' to indicate this. When they boot, only the 'GEM' partitions are given ICONs on the desktop. Intervening partitions of other types are ignored. Thus the First GEM partition is called C:, the Second GEM partition is called D:, etc.

The easiest way to get a random number is with the XBIOS random
function.

```
FUNCTION Random : Long_Integer ;
XBIOS(17) ;
```

This returns a 24 bit random number.

> ...
> Second how do you clear the screen in Personal??

I usually use an escape sequence to do this.

```
write(chr(27),'E') ; { ESCAPE 'E' -- CAPITAL E -- clears the screen }
```

This information comes out of Atari ST Internals from Abacus
Software, but there is apparently another book available that is a
lot better organized, though the name escapes me...I can find it if
there's any interest.

According to the April '89 issue of STart, FutureDOS (a Canadian company)
will soon be releasing an Ethernet controller board
called TAXI (The Atari eXtended Interface) for the 520s, 1040s and

Megas. (The 520s and 1040s communicate thru the DMA port, while the
Mega uses the internal bus.)

For further info:
FutureDOS R&D
1207-120 Torresdale Ave
North York, Ontario
M2R 3N7
(416) 736-0321

The price of the boards is expected to be in the $1K-$2K range.

To: info-atari16@score.stanford.edu

I would like to upgrade my 520ST (new model) to 1Mb RAM. My ST contains a bank of 4 256kx4bit RAM chips (NEC part number D424256C-10) with space for 4 more. It looks as if the decoupling capacitors are already there. Does anyone know how to do the upgrade? Is it just a case of putting in the new chips ? (In sockets of course). Please mail replies and I'll summarise. Thanks for your help.

Regards,

Warwick

Subject: Crippled mice

I was interested in the messages last week about mice "dying", because one of our rodents started exhibiting the same behaviour (only moving horizontally & not vertically) the day before. The messages suggested to me that the cause is the loss of pulses on one of the four outputs (two for each axis), and blocking the light-path to one of the phototransistors on the good axis duplicated the behaviour on this channel too.

A little bit of investigation showed that each phototransistor is connected between +5V and a resistor to ground; the signal developed across the resistor is then fed to one section of an LM339 quad-comparator. The reference for the comparator was 0.20V, and the output should switch between 0 and 5V as the input passes through 0.2V. A multimeter showed that one signal from the faulty axis was only just coming up to 0.2 while the other three were reaching up to 0.3 to 0.4. Obviously the circuit characteristics had changed enough with time that the output pulses were no longer being reliably generated. The quick fix was just to increase the sensing resistor from 470 to 820 ohms, since for small signals the phototransistor should develop a given current flow; passing this through a higher resistance gives a proportionately higher voltage.

I hope this info might be of use to anyone with a dying mouse and a little bit of electronics equipment (hint: SolderWick or a SolderPuller are highly recommended when unsoldering the resistor, as the circuit board is easily damaged).

How does a program do this? Presumably terminate-and-stay-resident, but how does it intercept keypresses?

A couple of years ago Moshe Braner (where's he gone?) posted a program which did this but it shoved the screen into a reserved area of memory he called the "barrel"; then you could dump the barrel to a Degas file. I'd like to try writing a program which instead created a .TNY format screen file every time alt-help was hit.

Very much in the same vein: I just got a NEC Multispeed MS-DOS laptop (used--mostly for use as a second terminal to do debugging on the ST). It has a funny connector on the back, and there is a claim that it can pretend to be external floppy drives on a desktop MS-DOS machine. Can the same thing be arranged with an ST? Believe me, it would be the steal of the century if that portable could pretend to be a pair of double sided drives for my ST.

If you have Laser C, you should seriously consider getting the upgrade to the newst version, and then get the Laser C Source Debugger. It's an excelllent debugging tool, and it works flawlessly in the Laser C environment. (It also works well from Gulam)

427. Atari's fourth quarter

Newsgroup: comp.sys.atari.st
Date: 1989-03-13 11:48:54 UTC
From: to_stdnet@stag.UUCP
Message-ID: <739@stag.UUCP>
Source record: 249450

From: thelake!steve@stag.UUCP (Steve Yelvington)

Friday's edition of the Wall Street Journal carried a report that Atari Corp. lost $97 million in the fourth quarter of 1988, including more than $100 million in writeoffs and reserves charged to the Federated Group retail subsidiary. According to the article, Federated's fate will be announced soon; options include sale, spinoff and leveraged buyout.

Without the Federated losses, Atari would have made an operating profit of $9.3 million for the quarter, down from $21.2 million, a drop attributed to high RAM chip prices.

An Atari spokesman was quoted as saying that "a number of new items designed to complement the existing ST and MS-DOS product lines will be announced this year" and that RAM prices were dropping. Atari stock closed up 75 cents, at $6.50

428. Virus 101: Chapter 3

Newsgroup: comp.sys.atari.st
Date: 1989-03-13 14:24:23 UTC
From: woodside@ttidca.TTI.COM
Message-ID: <4035@ttidca.TTI.COM>
Source record: 249351
Cross-posted to: comp.sys.atari.st,comp.sys.apple,comp.sys.mac,comp.sys.ibm.pc

First, the mail:

Addressing a controversial topic is sure to generate some strong responses, and this one is no exception. Mail of the "Thank You" flavor outweighs the "You Idiot" flavor by about 4-1, so I'll be pressing on. The majority of the "You Idiot" mail is from senders who either admit, or display, limited programming ability. For the benefit of those individuals: I appreciate your concern. I am not attempting to aid in the spread of viruses, but in your own understanding of them, and ability to defend yourself. People with the ability to create a working virus will have found little or nothing they didn't already know in the preceeding postings. There is certainly nothing in them that isn't already available in the most fundamental books about personal computers. The preceeding postings are also written at a superficial level, and are missing quite a few specific things necessary to make a real working virus. Those missing items would add nothing to the layman's understanding of how a virus spreads or works, so are not included. You need not take my word for this; contact anyone you know who is knowledgeable in the system software field, and they will confirm it.

Sin of omission:

Part of a message received from Forrest Gehrke (feg@clyde.att.com):

...One method for a virus finding enough space to hide itself, that I have seen, you have not mentioned. I have noticed that the so-called Pakastani virus uses non-standard sectoring at tracks 37 and 38 for IBM PC diskettes...

Mr. Gehrke is quite right. I did forget to mention this technique. While I had heard rumors of it being in use, I hadn't seen it in any of the virus code I've captured (again, I'm in the Atari ST world).

I have responded to all mail I have recieved (if it requested a response) including mailing out copies of missed chapters. Several responses have been returned by various mailers. If you requested something, and haven't heard from me, either your request or my response failed.

Now, Chapter 3:

Once a virus has installed itself, and replicated as frequently as it has found the opportunity, it will eventually launch whatever form of attack it was originally designed to do. That attack is the real purpose of the existance of the virus. Everything up to this point has been for the sake of getting to this stage.

What will it do? Almost anything. The limits are imagination and code space. The most benign virus I've seen claims to be an anti-virus. It blinks the screen on boot-up. The idea is that if you see the screen blink, you know that the benign virus is on the disk, rather than a more malicious one. It does, however, spread itself just like any other virus. From there, things proceed through the prank levels, time-triggered, messages, ones which try to simulate hardware failures, to ones which destroy files and disks. The actions vary from virus to virus. And, of course, there is a whole different library of viruses for each machine type. Attempting to detect a virus by describing or recognizing the symptoms is not only a task of limitless proportions, it is too little too late. When the symptoms appear, the damage has already been done.

Several viruses attempt to simulate hardware problems. (Conversly, I've had several pleas for help with a virus that proved to be other types of failures.) Frequently these viruses use timers to delay their actions until the system has been running for some time, and to spread out their activities to make the problem appear intermittent. Such virus induced glitches include occasionally faking succesful disk I/O, while actually not performing the read or write, altering the data being read or written, and (more commonly) screen display glitches. It is very difficult for anyone to determine whether such incidents are the results of a virus, or a real hardware problem. When such incidents start to occur on your system, start executing whatever virus detection software you have available, before lugging your system off to a service firm.

Previously, I mentioned the use of write protected disks as a step in the right direction to protect yourself. A large percentage of personal computer systems now use hard disk systems. Floppy disks are more often a backup media, or offline storage of files not needed on the hard disk for day to day use. Backing up requires the disks to be writeable, as does archiving off the infrequently used files. It is good practice to write protect the archived disks as soon as the files are copied to them. Run whatever virus checking software you have on the archive disks, write protect them, and then file them away.

(When reading the following suggestions about protecting your system from attacks, keep in mind that not all techniques can be applied to all systems or all software. Read the documentation accompanying the software before your first attempt to use it. Be familiar with what it is expected to do before you run it, and you'll be more able to recognize unexpected activity.)

The next step is to apply write protection to whatever disks you recieve software distributed on, before ever inserting them into a computer. Be they Public Domain, User Group Libraries, Commercial Software, or whatever, write protect them before you first read them. Then, make a backup copy if possible. Finally, when first executing the new software, have only write protected disks in your system. You should be well aware of any legitimate attempt to write to a disk by the software before it happens, and have adequate opportunity to insert a writeable disk when the proper time comes. This will not only give you a clue to the presence of a virus in the new software, but also protect the new software from a virus already resident

in your system.

If your system supports the use of a RAM disk, copy new software into the RAMdisk before executing it the first time. Put write protected disks in the drives, then execute the software from the RAMdisk. If the software has no reason to access other disks, especially when starting itself up, be very suspicious of any disk activity. The most common time for a virus or trojan horse program to do it's dirty work is at startup, when it is impossible to tell whether disk access is part of program loading, or some clandestine operation. By having the software loaded into and executing from memory, you will be able to detect any disk I/O which occurs.

Finally, backup everything. Hard disks, floppy disks, tapes, whatever. Make backup copies, write protect them, and store them in a safe place off-line. If you are attacked by a dstructive virus, your first problem is to rid your system of the virus. Do not go to your off-line backups until you have determined if your problem came from a virus, and if so, that you have removed it from the system. A backup is useless if you give a virus a chance to attack it as well as your working copy.

A significant portion of these three chapters have been related to boot sector viruses. While the most common type in the Atari and MS-DOS world, they are certainly not the only type.

What follows is next is mostly a re-phrasing of an article from "Los Angeles Computer Currents", June, 1988. There are a few direct quotes from the copyrighted article. While I do not agree with all that this article states, I can not disprove the items from a position of experience. Since my efforts here are to inform, you may judge for yourself. A significant portion of my remarks are oriented to the Atari ST, but the concept is true to most all personal computers.

An article in that issue, by Lewis Perdue, outlined the problems he faced when the IBM PC running Ventura Publisher he was using to create the first issue of PC Management Letter became infected. I won't begin to copy all that, but the most interesting part of the recovery task was when they used a normal (high-level) format program to clear the hard drive. It didn't kill the virus. They had to resort to a low level format, and rebuild from all original distribution disks. Their backups had been infected as well as their working copies of the software. They relied on a PC specific tool called Data Physician, by Digital Dispatch, to aid in the detection of the virus. It implements techniques to diagnose infections, but it has to be installed before the virus strikes.

Another, more interesting aspect of the article, was categorizing viruses into four groups: Shell, Intrusive, Operating System, and Source.

Shell - these "wrap themselves around a host program and do not modify the original program." In laymen's terms, such a virus would tack itself onto a program file, so it would get loaded with the program. It would have to do this in a manner that would cause itself to be executed before the host, since the host certainly would not pass control to the virus.

This would be quite a complex task on an Atari ST (and on systems with a similar structure for executable program files). The virus program would have to be quite large in order to deal with the structure of an executable file on the ST. In simple terms, an executable file (a program) is a series of unique sections: a header, the code, data, a relocation map, and possibly a symbol table. The header specifies the size of each of the following segments. The code is the program, but in a form which will not run until it has been relocated. The data is constants, literals, messages, graphic data, etc. The relocation map tells the ST what changes to make to the code before it can be run. The symbol table is not usually present, except during program development. The reason behind this structure is that when a program is created, it does not know where in memory it will reside when it is executed. Things like RAMdisks, device drivers, accessories, printer buffers, spelling checkers, and so on, may or may not be present in the computer when the program is run. Since each of those things require memory, the place where the program will wind up being loaded is unknown. So, when it does get loaded, it has to be told where it is. And, since the program will almost always contain references to itself (subroutines, variables, etc.) it has to be modified so that those references point to the right place. That's what the relocation map is for. It details how the program has to be modified. Once the program is loaded into memory, and fixed up, the relocation map and symbol table are discarded. So, to hook into a program file, a virus would have to split the program file, attach itself to the beginning of the code segment, (that's where execution begins), re-attach the data, relocation, and (possibly) symbol table segments, update the relocation map (all the original references would now have moved), update the header, then re-write itself to the original disk, assuming there was room on the disk for the (now bigger) file and that the disk was not write-protected. That's a large amount of work to develop, and a large amount of code to sneak into a system for the original infection.

I should mention here that it is not difficult to write "position independant" code on most micro-processors. You have to set out to do that, though, and take the necessary steps along the way to keep everything position independant. Boot sector code is a well known example. The address where the boot sector will be loaded into memory is unknown, and there is no relocation done on the code. It has to be position independant. It also has to fit in the boot sector. If it needs more than the amount of space in the boot sector, it has to determine its own location, and load the additional code itself. Of course, that means that it had to have a place to store the additional code, and it had to know where to find it. Those items were covered previously.

Detecting a "Shell" type virus is not difficult. When it attaches itself to the target program, it must increase the size of the file. While it would be a real nusiance to check file sizes on a regular basis, there are programs available to do this for you. An "alteration detection" program will typically accept a list of programs to recognize. It will write a data file of its own, noting characteristics of each file in the list, such as length and date, and then run a numeric algorithm across the file. The numeric algorithm (typically a Cyclic Redundancy Check, or CRC) will yield a value which is stored in the alteration detection program's own data

file. Then, on each subsequent execution of the alteration detection program, it checks the recorded characteristics of each file in its list, and re-executes the algorithm on the files. It reports back any file which has been changed since it last executed. Needless to mention, such a program must be run on the files to be monitored before any virus has an opportunity to attach itself to those files. Then, it must be run frequently to have a chance to detect altered files.

(Back to the types of viruses defined in the article)...

Intrusive - Intrusive viruses work by patching themselves into an existing program. This type of virus has two possibilities - either it is willing to render the host program useless, or it will attempt to co-exist with the host. If it is willing to corrupt the host, this is not too difficult a task. It would replace a part of the host program, modify the relocation map, and wait to get run. When it did, it would abandon the original task of the host program, and launch its attack. An example of this would be the virus bearing version of a word processor which struck the IBM compatible market some years ago. It signed on, looking just like a popular shareware program, but it was busy re-formatting the hard disk while the user waited for it to load and get ready to accept input.

The other flavor of intrusive virus, which attempts to co-exist with the host program, is terribly difficult to create. It has to modify the host in a manner that either accomplishes the host's task while also doing it's own, or find a part of the host that is infrequently or no longer used, and hide there. It would then have to modify some other part of the host in order to get itself executed. In either case, a virus of this type has to be aimed at one specific host program. There's no way it could perform the analysis necessary to locate such portions of a randomly selected program. For that reason, an intrusive virus has to target some program that resides on a large portion of the target computer's installations, and that it is certain will be available to tamper with when the virus introduction occurs. That normally means either the Operating System, or some utility program so common that it is found virtually every where.

Operating System viruses work by replacing a portion of the Operating System with their own code. This is similar to the intrusive type, except that it can use a new trick (and there are ones that do this on the IBM/MS-DOS computers). As a part of the operating system, it can sneak out to a hard disk, find an unused part, mark it as defective, and hide there. That would mean only a very small part of the code would have to be hooked into the operating system (possibly as an entry in a list of device initializing routines). That small segment could then allocate adequate memory for the real routine, and load it from wherever.

Source Code viruses - I found this type of virus to be a bit unbelievable. The article reads (I quote):

Source code viruses are intrusive programs that are inserted into a source program such as those written in Pascal prior to the program being compiled. These are the least-common viruses because they are not only hard

to write, but also have a limited number of hosts compared to other types.
(end quote)

Sounds to me like this would be nearly impossible to accomplish in after-market software. If, on the other hand, they mean a part of the program added by a devious member of a development team, then, it is credible. It brings to mind the story (which I can't verify, but I've heard it from enough different sources to believe it is true) about what may well have been the first virus. In case you're not familiar with "C" compilers, they are usually several different programs, which must be run in proper sequence, passing files and options from one to the next. Usually, this is all done by a another program, a "compiler driver", which is almost always called "cc". You execute "cc", passing it the necessary flags, and the name(s) of the program(s) you want compiled, and it drives all the necessary tasks to do it.

This was reported to have been done by one of the originators of the UNIX operating system, (name deleted), back in the development days at Bell Labs. Well, the story goes, he wrote the first versions of UNIX, "C", and "cc". He had a "back door" to get into a system running UNIX. He built the back door code into "cc". The code in "cc" checked to see what it was compiling. If it was the module "login", it incorporated the back door into the module, so that he could get into the system. If, on the other hand, it was compiling "cc", it included the code both to re-create itself, and the code to build the back door into "login". So, every "cc" had the code, and consequently every UNIX system included the back door. Eventually, it was discovered, and removed. There followed a frantic rebuilding of every UNIX system in existance, so the story goes.

This is the final chapter which will be distributed via cross-posting. Chapter 4 will relate specifically to viruses captured in the Atari ST environment, and will be posted only to comp.sys.atari.st. It will come out about 1 week after this one. This article was posted on March 13, 1989, so you can determine the approximate delay to your receipt, in case you don't read that newsgroup, but wish to locate the fourth chapter in comp.sys.atari.st.

End of Chapter 3.

429. Re: Adaptec controller boards

Newsgroup: comp.sys.atari.st
Date: 1989-03-13 15:06:18 UTC
From: al@tolerant.UUCP
Message-ID: <4021@tolerant.UUCP>
Source record: 249352

The 4000 will work fine with the ST. The main thing the 4000A adds is removable media. I have built hard drives using both the 4000 and the 4000A, and have had no problems. I use the 4000A because were I buy them, the 4000s are old (down rev). The 4000A costs about 50% more. What I would like to see is a list of ALL the SCSI drives that will work. I know the Seagate N drives work fine. What other drives are in use?

al

430. CALL FOR DISCUSSION -- COMP.VIRUS

Newsgroup: comp.sys.atari.st
Date: 1989-03-13 15:26:10 UTC
From: jwright@atanasoff.cs.iastate.edu
Message-ID: <871@atanasoff.cs.iastate.edu>
Source record: 249353
Cross-posted to: news.groups,comp.sys.amiga,comp.sys.apple,comp.sys.atari.st,comp.sys.ibm.pc,comp.sys.mac

Currently, there is no place in the Usenet heirarchy devoted to the discussion of, and dissemination of information about, computer viruses. All I have contacted believe this should change. We therefore propose the formation of a new newsgroup: COMP.VIRUS.

This newsgroup will be devoted to the discussion of computer viruses. Topics shall include, but not necessarily be limited to, virus protection software, reports of new viruses, and behavior of viruses. This group will not be specific to any machine or class of machines. However, it is anticipated that the focus will be on microcomputers.

The newsgroup comp.virus will be moderated. This will be done not to limit distribution of information, but rather to limit the number of inappropriate postings. Unfortunately, the experience of the coordinators for the virus-l mailing list has shown this to be necessary.

Current plans call for this newsgroup to be gatewayed with the virus-l mailing list. We intend to maintain an archive for the newsgroup. Also, we have a European coordinator for the group to handle European specific information (conferences, archive sites, etc.).

This posting on March 13, 1989 initiates the mandatory 2 week discussion period. After that votes will be taken.

[PLEASE DIRECT ALL FOLLOW-UPS TO NEWS.GROUPS.]
[This posting has been sent with a wide cross-posting in order]
[to (hopefully) reach most of the interested individuals on the net.]
[If you don't know how to redirect your follow-up, please find]
[out before posting.]

431. MEGA2 CARTRIDGE PORT PROBLEMS

Newsgroup: comp.sys.atari.st
Date: 1989-03-13 16:00:15 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <890313.10001442.012690@SFA.CP6>
Source record: 249354

Aad and Jos wrote:

"we have mega-problems using the cartridge port on our MEGA ST2 and we think
it is a common problem for all MEGA's with a boardrevision higher than revision
4."

I had a similar problem with my Mega2 when using Spectre 128. After
about an hour of operation, the Spectre would crash. Obviously, the fault
sounded temperature related. Spraying *any* area of the mother board with
Circuit Freeze (my contribution to the ozone hole at the North Pole) would
correct the problem.
Strange...
My dealer ran a diagnostic on my Mega and could find no problems, even
when loading up the cartridge port. Note: the Spectre ran perfectly on other
Mega2's. Sound familiar? Hint: "There are not two STs which are created
equally."
The dealer's engineer, Dean Muller decided to get involved. He does
a lot of ST application hardware prototyping. After several days of
investigation, he discovered that (I'm not an electronic type) two ram
drivers were weak. He piggy-backed two new drivers on top of the old and
the problem stopped. The cost for the drivers was less than $5.00!!!
For my Mega, the drivers are located between the TOS chip area and
the memory chip area.
If anyone wants Dean's phone number and so forth, get in touch with
me. Such a simple fix but it took days to isolate.

It is interesting that he has had to do this fix to four Mega2's
in the past three months, all revision 5's. He says that it is not
the chip selection that is suspect, but the company which made the
chip. Only those revision 5.0 ST's with that brand chip has the
problems with the cartridge port.

432. IMG files / GDOS fonts / Spectre 128

Newsgroup: comp.sys.atari.st
Date: 1989-03-13 16:06:17 UTC
From: RY04@DKAUNI11.BITNET
Message-ID: <8903131606.AA21296@ucbvax.Berkeley.EDU>
Source record: 249355

In article <8903081558.dmb@TIS.COM> David M. Baggett writes :
>
>
>> From: shc1@ukc.ac.uk (S.H.Cogheil)
>...
>>To: dmb@TIS.COM
>>In-Reply-To: <8902131815.AA10307@TIS.COM>
>
>>Would you possibly have any info on the .img formats ?
>
>Unfortunately I don't. If you (or anyone else here) has info
>on .IMG, send it along to me and I'll add it to the list.
>
> Dave

In fact there exists an information about *.IMG files. I will try
to discribe this format now.

At the beginning of each IMG file there is a structure with following
format :

```
typedef struct
{
int im_version; /* version number of image file */
int im_headlength; /* length of header in words -> you
should ALWAYS check this value
and skip the rest of the header if
this value is greater than 8 !! */
int im_nplanes; /* number of colour planes */
int im_patlen; /* pattern length in bytes;
normally 2 */
int im_pixwidth; /* pixel width in thousands of mm */
int im_pixheight; /* pixel height in th. of mm */
int im_scanwidth; /* line width in pixels */
int im_nlines; /* number of lines */
}
```

the picture information is structured in three groups :

- monochrome pixel series ("solid run") are stored as simple byte.
In this case bit no. 7 gives the status of the point, on or off.
bit no. 0-6 give the number of pixels to draw.
- pattern series ("pattern run") have as first byte a "0" and as
second the number of of repeats. the length of a pattern is stored
in "im_patlen". You see, the first two bytes are followed by as many
bytes as are needed to describe this pattern.

- picture informations which are difficult or aren't to be shortened
("Bit String") are stored without compressing. In this case the
first byte is $80 and the second gives the number of bitstrings.
Behind byte 2 follow the bytes of the bitstring.

If there more than one line with the same content they are coded
in following way :

```
typedef struct
{
int sc_zero; /* always 0 */
int sc_ff; /* always 255 */
int sc_cnt; /* number off coded scanlines */
}
```

ATTENTION !!
Information can be found only for one line and one plane. You should
take care that always a line with a full byte number is coded, although
the picture in fact can be smaller. So it can be that there are up to
7 bits more information. The real picture width stands in
"im_scanwidth".

Well, I think that should be enough.

Now, I have a problem of my own and hope someone on the net can help me.

1) Do there exist any FONTS for GDOS which are NOT Swiss or Dutch
or Rockface and if they do, in which sizes are they available ?

I want to write a program which uses full VDI interface and will
work expressive with texts. So I have a great interest to get
fonts in style ea. helvetica,times,swiss,symbol in sizes 7,9,12,
14,18,20,24 (28) points like on the mac.

Does anyone have an idea to get these ????

2) What's about this Spectre 128 where you are talking of ? Can any-
one explain this to me ? (what for ROMS ? Which converter ?
where could I get it ? how expensive is it ?....)

Thanks, Valentin

P.S : Please answer NOT to the List but direct to me..

433. LEAVING MONITORS ON

Newsgroup: comp.sys.atari.st
Date: 1989-03-13 16:23:21 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <890313.10232072.012690@SFA.CP6>
Source record: 249356

"I have heard rumors that leaving your monitor on when it is not connected to the Atari may cause problems. Does anyone have any information about this? I use Monitor Master and as I switch back and forth, I am not turning my monitors on and off."

It is not good to leave ANY monitor running when it doesn't have a load, that is, signal feeding into it. The horizontal oscillator, so I'm told, doesn't have anything to lock onto. TV studios, if leaving a monitor on without a 'picture', will feed what they call is SIGNAL BLACK to keep the monitor stable.
Instead of using Practical Solutions' Monitor Master, I'd recommend Astra's monitor switcher when trying to solve this problem. It is really a superior product, from my point of view as a user only, in that it kills power to the unused monitor. It also gives you the option to turn power off to a monitor via a switch, to tap into the audio, and to kill power to the audio for the monitor for routing to a stereo.
Switching from one monitor to another is easy enough with a switch and the un-used monitor will be denied power.

Larry Rymal <Z4648252@SFAUSTIN.BITNET>

434. Federated: Dumped by Atari! Shame on you, Atari!

Newsgroup: comp.sys.atari.st
Date: 1989-03-13 16:28:58 UTC
From: pa1132@sdcc15.ucsd.edu
Message-ID: <1308@sdcc15.ucsd.edu>
Source record: 249357

According to a Federated employee in El Cajon, CA store, Atari has seperated itself from Federated. Now Federated is in its own completely, and is expected to be bankrupted soon. Atari is said to make "megabucks" by doing this because it can deduct the Federated loss from tax. Federated is left to die on its own. We should condemn Atari for its irresponsibility! And if Atari can do this to Federated employees, nobody knows what Atari can do to Atari employees in the future!

Your right. People should check their facts before posting.

The 4000 and 4000A are both 100% compatible with the ST. You
can even format drives on one and use them on the other.

I too have used G+Plus quite extinsively and found it to be an excellent program...one of the best I`ve seen yet for the ST. I use it rather frequently during my Easydraw sessions and have noticed a markedly favorable increase in screen updates. I would definitely recommend giving this program a trial run.

>
> What will I miss out on if I do not get TOS 1.4? Anything?

FOLDRXXX.PRG is a partial patch; it DOES NOT completely fix the underlying memory allocation problems of TOS 1.0 or 1.2. Also, rather than just tromping on memory, TOS 1.4 checks for table exhaustion.

My experience with TOS 1.4 is that its FAT access speed is better than TOS 1.0 or 1.2 with the various public domain "patches".

TOS 1.4 gives you a cleaner auto-execute of GEM programs (for example, NEODESK comes up much more naturally).

One easy solution... Gentle lift the ST up about 4 inches and drop *sharply*
on the tabletop. This actually works much better than it sounds. The chip
sockets for most of the ST's, especially the old ones, were
absolutely the *CHEAPEST* ones that Atari could buy. My ST used to exhibit many
of these symptoms, and I got fed up with it and brought it in to a de-solder
station and removed all of the sockets and replaced them with new, (and more
expensive ;-() sockets, and have had very little problems with it since. It's
a little radical, but it sure fixed it up proper.

>

Right quote, wrong conclusion... I have both ACB-4000 and ACB-4000A
and they work *exactly* the same. In fact, the only difference that I could
find is that the board layout is slightly different, and the mounting holes
in the 4000A match the mounting holes on the bottom of a 5.25 hard disk, where
the older 4000 board does not. The way I would then read the above quote from

the ACB-4000 manual is that the 4000A is a (newer) replacement for the 4000 *OR* the 4010. So, buy the 4000 if you "get a deal on it" (Time Line has the 4000 in their ad for $60, but it's really a 4000A), otherwise buy an OMTI (its faster ;-)).

Chris,

My roommate's Mega ST2 has 6 sockets for TOS, but only two are occupied. We finally got the nerve to open the computer the other night (he purchased it last August). He has the older motherboard with space for 2 more banks of 1megabit chips, and as I said, 6 TOS sockets. There is also an interesting modification to the 68000. A few of the pins on it are bent UP, with wires running to a 7474 chip (if my memory serves me correctly). And the 7474 chip was piggy-backed onto another chip!!!! Interesting, to say the least. The drive came out nicely, easily detachable from the motherboard to which it is connected via a ribbon cable and power cable. There is a place to plug another drive in (such as a hard drive), an internal DMA port, and of course, the expansion bus. I was surprised to see how much room is really available inside the Mega case.

Oh yes, it is a Rev. 5 motherboard.

Concerning the Megafile 30 :
The answer is, look inside. The old SH204 had an atari-made ACSI->SCSI
card connected to an adaptec 4000 connected to a seagate 225. The Adaptec
cards ARE capable of controlling 2 disk mechs at a time. As I recall, the
megafile 20 my friend has had only a single, large board in it. Look for
a spare 20 pin connector inside the drive -- probably right next to the
connector that attaches to the 30 mb mech.
It seems to me that there's not enough room in a megafile for a second mech.
If this is the case, a second power supply and etc would bring the total cost
up to near the cost of a complete extra drive, which could be daisy-ed
through the megafile, right?
If there's no other connector, you could always just sell off the current
30mb disk mech and replace it with a larger capacity one.
I am rather interested in what exactly IS in a megafile 30, so if you
or anyone else knows already or finds out, I'd like to hear.

FOLDRXXX.PRG only *raises* the limit on TOS previous to 1.4 (with a cost of RAM). TOS 1.4 actually fixes the problem.

>DISKFREE.PRG speeds up the slow FAT access

Is a hack (with a bug) that only speeds up the GEMDOS Dfree() function.

>STARTGEM.PRG allows GEM codes to autoexecute

Is also a hack - that uses undocumented features (the worst programming sin! :-)

>STARTUP.PRG allows system reconfig on boot (my start up screen says:
> M=Mac I=IBM A=Atari
> to run Spectre, PC_Ditto, GEM

Very handy!

> [...parts deleted...]

>Why, pray tell, would I want TOS 1.4; my Mega 2 with a Megafile 20 blows away
> [...]
>What will I miss out on if I do not get TOS 1.4? Anything?

Bug fixes and many other enhancements that AUTO folder and applications programs can't hope to add to TOS. It sounds like you have read a magazine article or two that only skims the surface of what was done to TOS to create version 1.4

Some nice features:

CACHEXXX.PRG can be used to increase TOS 1.4's internal buffers - this means that FATs and directories stay in RAM. Dfree(), FAT searchs, directory searchs can now happen in RAM. Much speed increase here.

The File Selector can now be passed a string, such as "Load configuration file" no more tacky boxes sitting above, below, or beside the Item Selector.

Move file(s) from Desktop with display of destination folder/file name. File copying with time & date stamp retention. The ability to rename folders.

Format/Copy disk condensed into one dialog, with disks formatted being
MessyDOS compatible.

...and much more...

Best off all, it dosen't use up any RAM. :-)

In article <305@hydra.gatech.EDU> iadt2tg@prism.gatech.EDU (Terry O. Greenlaw) writes:
|What is the quickest way to find out the total byte size of all files
|in the current subdirectory? I need the size to do the equivalent of
|a "ls -l", and I'd rather not add up the individual file sizes.

As far as I know TOS only has a call to get the size (used and unused)
of a device (my handbook says: GEMDOS 0x36, Get Disk Free Space; my
compiler calls it : Dfree()). So probably summing up the sizes is the
only way to go (correct me if I'm wrong).

I wrote once a UNIX style du; du -s gives you the number of blocks used
by all files in the current directory (recursively); du -a gives the
block usage for each file individually too. If that's what you want I
could check it out and submit it to the sources / binaries groups.
You can try to outperform this by reading the directory sector(s), but
I doubt if it's worth the effort.
Anyone interested send me fanmail.

Leo.

445. MailTruk versions.

Newsgroup: comp.sys.atari.st

From: logajan@ns.UUCP
Message-ID: <1200@ns.UUCP>
Source record: 249368

In case anybody saw/sees the version of MailTruk (a GFA Basic source version of uucp) as it is even now being propogated by comp.sources.atari.st, please be advised that it may not function on machines with less than one meg of memory. I have gotten around the apparent GFA Basic bug that causes problems in 512k machines. The fixed version is V1.1.

I am sending the fixed version to the source.atari moderator, and perhaps it will be distributed in about two months or so. For those who want it earlier (a big rush of people, no doubt:) you can get it from me directly.

446. More on bugs in dLibs

Newsgroup: comp.sys.atari.st
Date: 1989-03-13 17:53:27 UTC
From: mj@myrias.UUCP
Message-ID: <947@myrias.UUCP>
Source record: 249369

Seeing David Brooks posting, relayed by Steve Yelvington, gave me
enough of incentive to look a little bit closer also at lmemcpy
code, as distributed with dLibs 1.2. Sure enough I found that
it exhibited the same set of problems as memcpy. So here is
a replacement code, quite obviously derived from a code by David.

```
* lmemcpy.s - replacement for a code in dLibs 1.2
*
* After memcpy by David Brooks - Michal Jaegermann, 11 Mar 89
*
* char *lmemcpy(dest, source, len)
* char *dest at 4(sp)
* char *source at 8(sp)
* unsigned long len at 12(sp)
*
* Avoid "btst #n,dn" because of a bug in the Sozobon assembler.
* If parity of both adresses the same - copies in 16 byte blocks.
* One has to stop loop unrolling somewhere.

.text
.globl _lmemcpy
_lmemcpy:
lea 4(a7),a2 ; Point to argument list
move.l (a2)+,a1 ; a1 = dest
move.l (a2)+,a0 ; a0 = source
move.l (a2),d2 ; d2 = len
beq lmemcpy6 ; return if zero

move.l a0,d1 ; Check for odd/even alignment
add.w a1,d1 ; This is really eor.w on the lsb. Really.
asr.w #1,d1 ; Get lsb into C. If it's 1, alignment is off.
bcs lmemcpy7 ; Go do it slowly

move.l a0,d1 ; Check for initial odd byte
asr.w #1,d1 ; Get lsb
bcc lmemcpy1
subq.l #1,d2 ; Move initial byte
move.b (a0)+,(a1)+ ;
lmemcpy1:
moveq.l #15,d1 ; Split into a longword count and remainder
and.w d2,d1
lsr.l #4,d2 ; for 16 bytes at a time
move.l d2,d0 ; a second counter for dbra
swap d0
bra lmemcpy3 ; Words (!!) d2 and d0 could equal 0.
```

```
lmemcpy2:
move.l (a0)+,(a1)+ ; Copy 16 bytes
move.l (a0)+,(a1)+
move.l (a0)+,(a1)+
move.l (a0)+,(a1)+
lmemcpy3:
dbra d2,lmemcpy2
dbra d0,lmemcpy2

bra lmemcpy5 ; Enter final loop. Again d1 could equal 0.
lmemcpy4:
move.b (a0)+,(a1)+ ; Up to 15 trailing bytes
lmemcpy5:
dbra d1,lmemcpy4
lmemcpy6:
move.l 4(a7),d0 ; stick return value into d0
rts ; All done.

lmemcpy7: ; Handle the odd/even aligned case
move.l a1,d0 ; d0 = dest, ready to return
subq #1,d2 ; here d2 was positive!
move.l d2,d1
swap d1 ; second dbra counter
lmemcpy8:
move.b (a0)+,(a1)+ ; move byte-by-byte
dbra d2,lmemcpy8
dbra d1,lmemcpy8
rts ; and exit normally
```

lmemcpy is used internally by realloc. Since malloc has to return
nicely aligned addresses, hence in this case we luckied out and an old
version of lmemcpy will work for realloc, maybe even a little bit
faster. :-). Unless your program will pass to realloc some funny argument.

And one more thing. dLibs documentation claims that length parameter
to memcpy and lmemcpy is either int or long. Code documents and works
with - more logically, but with some discrepancy with U*IX library -
unsigned quantities. Accordingly to ANSI standard specification
length parameter to memcpy has to be of size_t type, where size_t is
an integral type specified by an implementation. This means that
unsigned int, or unsigned long, are ok, if you said so. Watch out for
these until things get fixed.

447. MS DOS mouse model number

Newsgroup: comp.sys.atari.st
Date: 1989-03-13 17:56:54 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <890313.11565406.012765@SFA.CP6>
Source record: 249370

I've been trying to post mail to richb@ucbvax.Berkeley.EDU privately
in an attempt to declutter the net with my messages, but I'm barraged with
the infamous 'RETURNED MAIL' error message. Sigh, what else is new?
Anyway, regarding the use of the MS DOS mouse, what is the model number?
Also, in reference to a bussed mouse and serial mouse. Which one is the
ST's? Does it matter since the user will be modifying the connector anyway.
At any rate, which mouse should we be searching for: bussed or serial?
This is all a little redundant due to Atari's excellant return policy.
The pricing is great, but I'd like to at least have the option of using
a different brand mouse in case I can't find any Atari mice in my area,
especially since my mouse is the Hong Kong one.

Larry Rymal <Z4648252@SFAUSTIN.BITNET>

448. comp.virus - early voting

Newsgroup: comp.sys.atari.st

Folks,

I appreciate your enthusiasm for the creation of comp.virus.
However, we must play by the rules of the game. I posted the
call for discussion not more than an hour ago, and votes are
already coming in. To avoid unnecesary hassles, all early
votes will be met with the following.

> Dear Usenet Reader,
>
> Thank you for your vote regarding comp.virus. Unfortunately,
> the Usenet guidelines do not allow votes to be collected
> until after the two week discussion period has expired.
> Please watch for the call for votes. I will post it to all
> the groups originally covered in the call for discussion.
>
> Sorry for the inconvience, but thanks for your concern.

jlong@blackbird.afit.af.mil.UUCP writes...

> I have a basic question along the same line as this thread is going, (I
> think). I have the chance to get a CDC WREN-I 36 Meg drive. Qustion:
> Is this drive (it is supposed to have an ST-506 interface) compatible with
> the ICD or Supra adapters and if so, which controller will I need for it?
> Please reply soon, as I need to close the deal for the drive ASAP.
> Thanks for any tips, warnings or encouragement! Jeff Long

The Wren I will work just fine. I put together my first hard drive about a
month ago using the Supra adaptor ($99.95), Adaptec 4000A SCSI controller
from Timeline ($60) and a CDC Wren I. It formatted down to about 31 MB.
The Wren is not in Supra's menu, so you should write down the following
numbers and use them:

Heads 5
Cylinders 697
Interleave 1
Reduced Write 698
Write pre-comp 128
Landing zone 698
Step pulse rate 4
Reserved tracks 0

I got this data from a CDC technician.

450. CompuClub stole many machines before they went Chapter 11

Newsgroup: comp.sys.atari.st
Date: 1989-03-13 19:30:43 UTC
From: MLS@s40.prime.COM
Message-ID: <8903132154.AA09667@ucbvax.Berkeley.EDU>
Source record: 249373

CompuClub in Framingham, MA screwed alot of people out of systems. One reason that they are no longer in business is that they did not pay their bills to Atari. That is probably the reason that systems sent to Atari last July were not returned to them.

The owner of CompuClub is (was) Thom Grazziano, and I understand he is still in the area. A couple of my friends got burned by him too. I was lucky, and got my system back unrepaired because I got tired of waiting and made a big issue out of the delay. (You wouldn't believe the stories Thom gave other customers while I was there, and most were gullible enough to believe him.)

I know of a number of people who would be interested in tracking down Mr. Grazziano for the purposes of a lawsuit. However, since I believe that CompuClub declared Chapter 11, this may not be possible.

Thom's second in command, Joe (I don't remember his last name) is now working at THE BIT BUCKET in Newton, MA. He may be able (though I'm not sure how willing) to provide more information on the whereabouts of missing systems or even Mr. Grazziano.

-Matt Stone
MLS@S40.Prime.Com

The views expressed above are not those of Prime Computer, who unfortunately run their own systems, and would not even think of using ST's.

> 1) Put out a smaller version (if this is possible) to fit into our
> machines.

TOS 1.4 certainly DOES fit in 192K (the ROM space for all STs), and you CAN upgrade a 520 or 1040 or Mega-2 or Mega-4... I don't know why you think you can't.

Some newer Megas have only two ROM chips, but that's because those two parts are cheaper than six parts. The addressable ROM space is the same for all current ST machines: 192K. The six-chip sets have 256K *bits* per chip, or 32Kbytes, and 192K is 32K times six. The two-chip sets have 1024K *bits* or 128Kbytes per chip, 256K total ROM space, but the ST can only address 192K of that.

TOS 1.4 will be available in both two-chip and six-chip sets, and can be put in all machines.

From: clf3678@ultb.UUCP
Message-ID: <433@ultb.UUCP>
Source record: 249377

I think a little history is needed.

The original 520 (which I own) and older 1040 machines used a set of 6 chips for it's ROMS. I believe these are 256k chips.

The new ROMS are larger, and need more room. Therfore, Atari used 2 1 meg chips. The pin-outs on these chips differ, so you cannot just stick the 1 meg chips into the 256k sockets. To interface the two (if it can be done), you need an interface board that will plug into the 6 sockets and hold the two new chips.

Now this can be done, OR Atari can put out a smaller version of the new ROMS that will fit into the 6 chip arrangement we have.

Date: 1989-03-13 21:06:53 UTC
From: clf3678@ultb.UUCP
Message-ID: <434@ultb.UUCP>
Source record: 249378

I would guess that the 6 sockets your roomie's Mega 4 has are for 1 meg chips, not the 256k chips I have. Why they are in there, I have no idea. Perhaps for the 68881 co-processor and other goodies. Atari has changed the design of the Mega motherboard quite a few times.

=cf=

456. More ELITE(tm) strangeness

Newsgroup: comp.sys.atari.st
Date: 1989-03-13 21:17:23 UTC
From: dag@per2.UUCP
Message-ID: <831@per2.UUCP>
Source record: 249379

I'm the person who posted a few days ago about the trouble that I'm having running ELITE(tm) from Rainbird Software on my ST. (Joystick problems) I've encountered another problem which is more serious.

If I play the game using the keyboard to control the ship, the program runs for a while and then bombs with either 11 or 22 bombs (I think it's 11 bombs, since that's the Line-F emulator trap, and exception 22 is listed as "reserved" in my M68000 reference -- the resolution changes to medium after the bombs appear, however, and I end up with 22 bombs and some strange artifacts on the screen) shortly after I leave hyperspace or when I've been practice docking for a while.

I've tried this with the mouse and joystick attached and removed in various combinations. I've also tried it with the serial, MIDI, hard disk and printer devices unplugged. Same thing. I have a RAM upgrade in my ST which gives me a total of 1meg, and a Z-time clock chip sandwiched in one of the ROM sockets on the system board. I doubt that either would be a problem. I've not had any problems with my RAM upgrade with other products. (This is one of the solderless upgrades which piggybacks with the shifter and has fingers which contact with the "MMU" chip.

As far as I can tell, I'm having no trouble with any other programs, though I must admit that I don't have many other "arcade" games (WizBall, MIDI-maze, and some PD stuff...) and programs like ELITE(tm) might just push my ST beyond its operational limits...

There was a problem a long time ago with some M68000's where under some "rare" instances the program counter or stack pointer would get screwed up when one interrupt came in while the processor was executing an RTE (or RTI), or something like that... I don't have the exact details. Is it possible that the M68K in my ST is of this vintage? I encountered this problem (and we received a revised chip) while working for DEC back sometime in 1984.

Any help is appreciated.

457. Bitnet Atari ST Forum proposal

Newsgroup: comp.sys.atari.st
Date: 1989-03-13 22:54:00 UTC
From: MCCABE@MTUS5.BITNET
Message-ID: <8903132254.AA12848@ucbvax.Berkeley.EDU>
Source record: 249380

Date: 13 March 89, 17:40:12 EST
From: Jim McCabe MCCABE at MTUS5
To: INFO-ATARI16 at SCORE.STANFORD.EDU
Subject: Bitnet Atari ST Forum proposal

A couple years ago, Paul Molenaar (spelling?) ran a weekly discussion group for Atari ST programmers and users. It died out, but I still like the idea (it might be one of the only good uses of Relay yet.)

I'd like to get the group back up, but first I'm going to need input from interested people as to *when* it should be held. (ESPECIALLY those in Europe, since that's where most of the ST activity takes place.) There's no way to please everyone on all the continents, but we should be able to find a happy medium.

Here's the scheme: everybody meets on some predetermined channel on Relay (say, channel 520), and they BS for a couple hours about programming problems, forthcoming program releases, etc...

It's a great way to get help with programming dead-ends, and probably kinda fun too.

Anyone interested please send mail to "MCCABE at MTUS5", and I'll try to find a good time to meet that will please most of those involved. I'll get back to everyone interested when I find a good schedule.

458. Calamus

Newsgroup: comp.sys.atari.st
Date: 1989-03-13 22:55:50 UTC
From: HEIMBIG@WSUVM1.BITNET
Message-ID: <8903132255.AA12916@ucbvax.Berkeley.EDU>
Source record: 249381

A review of Calamus in Sept Personal Publishing stated that Calamus can use 2 monitors at the same time. Is this right? I've seen such things with Mac II's but on the ST? If it is so can one be a monochrome and the other color?

Calamus has been advertized for months in STart but I don't think it has actually been available. Is there any one out there who has actually used it? Any problems? Does it bomb out the way PageStream does? how does it compare with PageStream (or other ST pub)?

I am very interested in a page layout program. WordUp and EasyDraw are great programs which I own and use constantly but are falling short of my my current need for page layout, so I'm look for something to augment them.

I know TOS 1.4 will work on 1040's. I've seen several 1040's running TOS 1.4; people who have close ties to Atari already have preliminary copies of the new ROMs. The only obstacle is getting Atari's legal permission to run the new version. In other words, I KNOW it's possible... it remains to be seen whether it will be legal. There's no good reason for it not to be available : it doesn't require anything harder than the original replacement of the tos-in-ram loader chips with the first ROM version did.. just take 6 socketed chips out and put in 6 new ones.

Chris,

I highly doubt that the extra 4 sockets in my roommate's Mega ST2 are for 'future upgrades' as Atari has apparently eliminated them in the latest Mega motherboard redesign. I am almost certain that all six sockets are for TOS chips, and once Atari went to the 2 chip set, the other four sockets were no longer used (hence, that is why they were removed, although I would have liked them to stay for future 'upgrades' that you spoke of).

As for the type of chips Atari is using for TOS, I am not sure. If both the 6 and 2 set TOS chips work with the Mega, perhaps Atari was smart enough in the early days that a 2 chip set might work with the older 520 motherboards. Maybe someone at Atari can answer this?

Sorry, but TOS 1.4 will only be supported in ROM form only. That means
no EPROMS or RAM based versions will be suppored by Atari.

This is due in part to the large number of RAM revisions that left Atari for
developer testing and the number of pirated EPROMs available off those RAM
versions.

In article <1308@sdcc15.ucsd.edu> pa1132@sdcc15.UUCP writes:
#According to a Federated employee in El Cajon, CA store, Atari has
#seperated itself from Federated. Now Federated is in its own
#completely, and is expected to be bankrupted soon. Atari is said to
#make "megabucks" by doing this because it can deduct the Federated
#loss from tax. Federated is left to die on its own. We should
#condemn Atari for its irresponsibility! And if Atari can do this to
#Federated employees, nobody knows what Atari can do to Atari
#employees in the future!

Frankly, that's life in the business community. If Federated wasn't making money, then why keep it around? But in any case, aren't you being a little melo-dramatic? Ditching Federated, a losing division, is not the same as getting rid of Atari employees. One could even argue that the move was for the benefit of Atari employees who's jobs could have been at risk by the losses suffered from Federated. Now, if Federated can now turn itself around, then we'll know that Atari made a bad decision. If not, then we'll know what Federated had in store for Atari. As further reference, note the following:

In article <739@stag.UUCP>, thelake!steve@stag.UUCP (Steve Yelvington)
#Friday's edition of the Wall Street Journal carried a report that Atari
#Corp. lost $97 million in the fourth quarter of 1988, including more than
#$100 million in writeoffs and reserves charged to the Federated Group
#retail subsidiary. According to the article, Federated's fate will be
#announced soon; options include sale, spinoff and leveraged buyout.
#
#Without the Federated losses, Atari would have made an operating profit of
#$9.3 million for the quarter, down from $21.2 million, a drop attributed
#to high RAM chip prices.
#
#An Atari spokesman was quoted as saying that "a number of new items
#designed to complement the existing ST and MS-DOS product lines will be
#announced this year" and that RAM prices were dropping. Atari stock closed
#up 75 cents, at $6.50

From: BROOKS%csss-a.prime.com@RELAY.CS.NET

Subject: More on memcpy() and related bugs

As we know, the version of memcpy() released with Sozobon fails
because the btst instruction is assembled improperly. Note the
following routines call memcpy():

initargs() (part of startup IFF XARG is used)
lsearch()
qsort()

so you must install a fix to memcpy() before any of these will work.

Furthermore, lmemcpy() and bzero() have the same bug, and realloc()
calls lmemcpy(). If they matter to you, it's no big deal to write
(slow) versions in C. Dale Schumacher is said to be working on
official fixes.

In article <4021@tolerant.UUCP> al@tolerant.UUCP (Albert Palmer) writes:
>The 4000 will work fine with the ST. The main thing the 4000A adds is
>removable media....

So, now I know. So the list is:
Adaptec 4000 - good if cheap and you don't want to use Bernoulli's
Adaptec 4000A - the currently popular board
Adaptec 4070 - if you KNOW that your media is good enough to withstand
the extra rigours of RLL

>What I would like to see is a list of ALL the SCSI drives that will
>work. I know the Seagate N drives work fine. What other drives are
>in use?

That I can do. This is the "ICDFMT.DAT" file from ICD, which lists all drives that ICD has used with their host adaptors and software. The parameter fields are number of heads, number of cylinders, cylinder at which to use reduced write current, cylinder at which to start using write precompensation, landing zone cylinder, and style of step-rate to use. How it's of some use. I also have a (hard-copy) list of supported drives from Berkeley Microsystems with more drive parameters.

468. This is the GDOS font format

Newsgroup: comp.sys.atari.st
Date: 1989-03-14 08:38:01 UTC
From: jeroen@ruuinf.UUCP
Message-ID: <1192@ruuinf.UUCP>
Source record: 249391
Body handling: HTML body converted to readable text

```
This is the GDOS fontfile format that so many people asked for.
It is adapted from the (Dutch edition of the German book)
"Software development on the Atari ST" by J. and D. Geiss,
which is quite a nice book.

A GDOS font-file consists of four parts:
1. an 88-byte header
2. a tabel that describes where the information for each character starts
3. an (optional) table that gives an extra horizontal shift to each char
4. the pixel data.

1. The HEADER consists of ints (2 bytes each), longs (4 bytes), and a string.
All values in the header are in Intel-format, i.e. low byte first.
In order to process them, you should first apply
(n>>8)&0xFF + (n<<8)
to each int value n, and likewise for longs.
Items in the header are:
int number of this font (1=system font)
int font size in points (1/72 inch)
char[32] font name
int lowest ascii value in font
int highest ascii value in font
int distance baseline to top of box
int distance baseline to ascenders
int distance baseline to e-height
int distance baseline to descenders
int distance baseline to bottom box
int width of widest character
int width of widest character cell
int left offset for slanted style
int right offset for slanted style
int number of pixels to broaden bold caracters
int thickness of underline in pixels
int mask for halftone style (normally 0x5555)
int mask for halftone slanted style
int flags: bit 0 set = system font
bit 1 set = optional table 3 is used
bit 2 set = data is in M68000 format (high-low)
bit 3 set = font is proportional
long pointer to table 3
long pointer to table 2
long pointer to font data
int number of bytes in a scan line
int number of scan lines
```

long pointer to next font

2. Next comes a TABLE which for each character gives the startbit
in the scan lines. There is one item more than the number of characters
in the font; the last item point to the first unused bit.

3. If flag 1 in the header is set, another TABLE is given
which for each character gives a (positive or negative) number.
Characters should be shifted right this amount of bits before output.

4. Finally comes the PIXEL DATA.
All characters are packed directly next to another, ignoring
byte boundaries. Data is stored one row at a time:
A font like this: would be encoded:
.*.***..**.***.*** 0x5C, 0xDD, ...
*.**..**..**..**.. 0xB3, 0x33, ...
******.*...*..**** 0xFD, 0x13, ...
*.**..**..**..**.. 0xB3, 0x33, ...
*.****..**.***.*** 0xBC, 0xDD, ...

469. RE: NOAA/METEOR project Mike Gore

>rather new at this and would be grateful for any help.
> Thanks,
> drc

I have had this same problem at times also. I have played around with it
and I have only one sure fire solution that works every time. If anyone
has a better solution, I like to hear it also.

My solution is send a short file from the Unix box to the ST first. Then
I am able to send the file I want to send from the ST to the UNIX box.

I would love to find a simpler way. I thought only I had this problem.
I guess I'm glad to hear that I am not.

mike

471. Re: Federated: Dumped by Atari! Shame on you, Atari!

Newsgroup: comp.sys.atari.st

Don't blame Atari, blame the Federated lawyers that misrepresented the
status of the company to Atari when they purchased it. Also, Atari
lost millions last year because of the debts run up by Federated
BEFORE Atari took it over. They had no real choice.

I have one connected to a Supra interface and to a Seagate ST251. It works just fine.

- David

P.S. A week or two back I asked about multisync monitors and about LISP. I've heard from some people about monitors, but had only one reply on LISP. I know some of you work with LISP on Explorers, etc. (some of the people who've contributed to this list have also contributed to lisp machine mailing lists, etc.). Doesn't anyone hack LISP on their ST?

Here's the trackball conversion docs that I used to convert my trackball...

Cut here
8<----------

CX22MOD.TXT

The following instructions explain how to modify an Atari
trackball (model number CX22) to work like a mouse for the Atari
ST (complete with left and right buttons).

To start with, if the instructions here are followed PROPERLY
(and you don't fry a chip) it should work just fine, however, I
make no claims as to the accuracy of this file, nor do I guarantee
that this will work for you.

NOTE: This modification will NOT retain the original "trackball"
or "joystick" modes of the ball.

WARNING: The following ONLY applies to the model CX22 trackball!
The CX22 can usually be identified by its case (the case matches
the 800XL series computer) which is dark brown on top with a white
bottom. When in doubt, flip it over and look for a model number!

If you have the older Atari trackball (solid black case),
don't dispare, there is also a text file on modifying it to work
like a mouse. The file can be found in the Delphi Atari SIG if
you need it (search with TRACK as a keyword in the ST database).

Things you'll need:

* An Atari trackball, model CX22
1 A Radio Shack joystick extension cable (part # 276-1978)
2 A low-wattage soldering iron (15 watt, or close to that)
3 A Volt-Ohm meter (you'll need to trace some wires)
4 About 2 feet of wire (small gauge will be easier to work with,
such as the wire in the joystick cable)

Before we get into this, if you're not familiar with electronics or soldering to IC's, PLEASE have someone else do this for you. Also, DON'T trust the colors on the wires in the Radio Shack joystick extension cord! Every one that I buy is different (Radio Shack seems to use a random color coding... makes it tough on us guys), so you'll need to trace the wires to see what pin on the plug they go too (thats what the ohmmeter is for).

To open up the trackball, remove the 4 screws on the bottom of its "wings"; it still wont come apart after that because there are 2 friction-fit posts inside it (both near the center of the case, one at the top and the other at the bottom), pry it apart slowly and gently to avoid breaking them. Once you open up the trackball, remove the old joystick cable (it doesn't have all the wires we need). Now get your Radio Shack joystick cable and clip off the MALE end and discard it (the end with the metal pins sticking out).
In case you don't aren't familiar with the the pin numbers of the joystick cable (the Radio Shack cable doesn't have them numbered, either), here's the layout:

Looking at the JOYSTICK end of the cable (female end):

5 4 3 2 1
9 8 7 6

Strip about 6 inches of the outer jacket off to expose the individual wires (you'll need a little length to work with). The only pin we wont be using is pin 5, so trace it first, and clip off it's wire (now it's out of the way for good!). Next trace all the remaining wires to their plug pin numbers and write it down someplace.

Look at the IC's in the trackball. Find the one marked LM339 (it's a 14-pin IC sitting away from the other IC's, directly south of where the ball sits).

The IC's pins are numbered as follows (standard IC numbering):
(looking at the top of the IC)

14 13 12 11 10 9 8
notch -->)
1 2 3 4 5 6 7

Make the following connections to it:

(Plug pin # to LM339 pin #)
1 - 2
2 - 1
3 - 14
4 - 13

Connect the following wires to the connector that the
original joystick cable was plugged into (look on the PC board,
the connector's pin 1 is numbered).

(plug pin # to PC board connector pin #)
8 (ground) - pin 1 (closest to center of the case)
7 (+5 v) - pin 2 (to the left of pin 1)

Jump a lead from one connector of each fire-button pad
(right and left pads) to pin 1 on the PC board connector (in other
words, ground them).

Make the following connections to the other side of the
fire-button pads (we're going to separate the right and left
buttons).

(plug pin # to --- pad)
6 - left fire pad
9 - right fire pad

Now hook it up to the ST to make sure it works properly.
Before you close it up I recommend that you strain-relieve the
cord. The easiest way to do this is to tie a knot in the cord
where it exits the case (this will keep it from being accidently
pulled out of the trackball). Close it up and you're done.

Special thanks to Norm Weinress for info on the LM339 pinouts.

From: ajy2208@ultb.UUCP
Message-ID: <440@ultb.UUCP>
Source record: 249397

I am absolutely positive that the Adaptek 4000A controller board is MFM and the 4070 is RLL. I have both of these boards and have formatted hard drives using both of them. Please don't confuse them when looking for a controller board!! You'd be very disappointed if you bought an MFM controller for an RLL compatible drive!! (you wouldn't get the maximum storage capacity)...

475. Three micros in one

Newsgroup: comp.sys.atari.st
Date: 1989-03-14 16:50:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8903150012.AA29706@ucbvax.Berkeley.EDU>
Source record: 249398

At work I use an ST full time but I have to provide technical support for
PC and Mac users. When I boot my ST a Degas Elite pic comes up and displays
an Apple style logo, an IBM style logo and the FUJI logo and asks
"Enter M to be a Mac, I to be an IBM-PC or A to be an Atari"
One keystroke later and my ST can be one of three machines.

For Mac emulation I use Spectre 128; The best thing ever to hit the ST market

For PC emulation I use PC_Ditto. Unlike Spectre which shows no speed
degradation for Mac emulation, PC_Ditto is SLOW. While I have used dBASE and
LOTUS under ditto, the slowness is tedious. Word Perfect is reasonable.
Now that I have LDW and dbMAN 5 for the ST I have almost no need to use ditto.
Ditto runs Norton utilities and I use this to clean up my hard disk; there
isn't anything in the ST world to compare with Norton.

Once Ditto II comes out I will buy it because it will perform like an XT
and I won't have to jump to a PC like I occassionally do to provide user
support.

The following is my batch file, used with STARTUP.PRG, to select which
computer I want my ST to be on boot up. I provide it as an example of how
to make the switch to various modes as painless as possible.

```
;============== STARTUP.INF for my 1040 ST ============================
display off ; turn echo off
;
clear ; clear the display
;
if ($res == high) then ; display a high res DEGAS picture on
graphics 23 c:\choose.pi3 ; the screen if using a mono system
endif ; asks if I want my ST to be a Mac, PC or ST
;
set jumper = $<<
if ($jumper == e) then ; exit start up routine (quick jump to desktop)
exit
endif
if ($jumper == m) then
echo d:\spectre\1spectre.prg >c:\startgem.inf ; let's become a MAC
d:\utility\startgem.prg
exit
endif
if ($jumper == i) then
echo c:\pc_ditto\ibm_pc.prg >c:\startgem.inf ; let's become a slow XT
d:\utility\startgem.prg
exit
endif
```

```
;
; run in Atari mode if m or i not selected
;
clear
echo c:\neodesk\neomastr.prg >c:\startgem.inf ; autostart NeoDesk in ST mode
d:\utility\startgem.prg
;
res medium ; boot in med res if colour monitor is used
;
d:\utility\multivec.prg ; load in the UIS file selector utility
d:\utility\uis_ii.prg
d:\utility\diskfree.prg ; speed up for DISPLAY INFO on a disk req.
d:\utility\g+plus.prg ; install G+PLUS
d:\utility\nite.prg ; screen saver
clear
;
accask ; select desk accessories to load in
```

****

I have found that I cannot stand to run my ST without NeoDesk 2, the UIS-II or G+PLUS. Anyone with a hard disk should have at least the first two.

NeoDesk has an interesting feature for Command Line Interpreter (CLI) freaks. Once the CLI and its path are defined, a simple CTL-B will start the CLI. For anyone who complains that GEM does not provide all the nitty-gritty "DOS" functions, define your CLI as GULAM, PCOMMAND, etc. and you're a keystroke away from CLI capability.

Just out of curiousity, how reliable a source is "a Federated employee"?

Atari has announced plans to sell Federated ASAP a few days ago (leveraged buyout, anyone?), but is this the same as "left to die on its own"?

Would Atari make more money by writing off Federated, or by selling it?

477. Still on sysem() in dLibs - retraction

Newsgroup: comp.sys.atari.st
Date: 1989-03-14 17:25:00 UTC
From: mj@myrias.UUCP
Message-ID: <953@myrias.UUCP>
Source record: 249400

I got some mail which indicates that I had to mix-up something
with system() in dLibs and I simply do not know on which side my
computer has a keyboard. Which is entirely possible...

It also could be some mishap in a beautiful word of "standard"
shells on ST. (Who needs a shell on WIMP computer anyway, right?). I
only know right now that I had some problems, which were rather easy
to repair. I will investigate a matter further and will send mail to
persons directly involved, leaving to them decision if to distribute
that further.

John Stanley informs me that list of bugs - at least for dLibs -
exists and Dale Schumacher, the author, maintains it. One can alse
send reports to John Stanley <dynasoft!john@stag.UUCP>. It is good to
know, since in the past I tried to write to Dale Schumacher, and I do
not think that he ever received my mail. One humble proposition,
though. If such list(s) exist(s) would be possible, from time to
time, not very frequently, to publish it/their contents. This would
prevent rediscovering the same bug over and over again and saved a
substantial amount of hair teared over perfectly healthy programs
which do not want to work.

Regards, and many thanks to all people
involved directly and indirectly in all
this great projects - dLibs, Sozobon, Gemfast, et al.
We love your bugs ;-) (clean code even more)

478. MWC CSD running on top of Gulam

Newsgroup: comp.sys.atari.st
Date: 1989-03-14 17:25:09 UTC
From: csrobe@ICASE.EDU
Message-ID: <8903141725.AA19501@icase.edu>
Source record: 249451

Well, I love MWC and I'm thankful for CSD, but I hate MSH so I use Gulam --
in fact I really like Gulam (even though I seem to bomb it when in emacs
from time to time).

Anyway, I've got a problem, csd won't load completely when executed from
gulam! I get the copyright message, the it says "Reading tables...",
and then it reads some source files ("Adding source: <filename>.c").
Then when it tries "Loading <pgm>.ttp" I get:

exit status -33
Fatal error: execute failed: {NULL}

-33 = File not found.

however, if I exit Gulam and run msh, it works! Now I don't want to
keep bouncing back and forth between Gulam and msh and I won't do my
development in msh! Does anybody know how to fix this?

I'm running the latest version of Gulam, the one that was built around
May 21 of last year (version number is something like 1.02.03.04 or
something crazy like that).

Any clues?

479. string.h for MWC

Newsgroup: comp.sys.atari.st
Date: 1989-03-14 17:26:40 UTC
From: csrobe@ICASE.EDU
Message-ID: <8903141726.AA19518@icase.edu>
Source record: 249452

In working with the ST UUPC code, I decided to develop a valid <string.h>
for MWC (Don't ask me why they didn't provide one, since it is definitely
needed!). Anyway, I have given the declarations as they appear in the
dpANS in large comments and the parenthetical comments use the sames names
for arguments (as if that really matters) as given by MWC.

enjoy,
-c

482. SPECTRE 128 and StartUpScreen

Newsgroup: comp.sys.atari.st
Date: 1989-03-14 18:54:21 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <890314.12542072.013346@SFA.CP6>
Source record: 249454

In David Small's latest newsletter (Number Two), he offers a hint in working with start up screens for the Spectre 128. Since Mac's StartUpScreen causes a crash, he says to use a program called BACKDROP.
From LISTSERV@RICE, I was able to download a file called BACKDROP which included a set of instructions. In it, we are told to create a SCREENS folder and to place that, along with a StartUpScreen file, into the System Folder. By placing several StartUpScreens within the Screens folder, we can have random startup pictures, ala SuperBoot!
However, I'm not having any luck. I get a garbaged picture for the startup picture. Has anyone else running Spectre experienced this and managed to massage a fix? Many thanks!

Larry Rymal <Z4648252@SFAUSTIN.BITNET>

483. TOS 1.4 vs NEODESK and UIS-II

One net user replied to my original posting as follows:

<Date: 11 Mar 89 02:57:44 GMT
<From: rochester!rit!ultb!clf3678@cu-arpa.cs.cornell.edu (C.L. Freemesser)
<Subject: Re: TOS 1.4 vs NEODESK and UIS-II
<To: info-atari16@score.stanford.edu

<Why would you want TOS 1.4 instead of UIS or NeoDesk?

<Because it is in ROM, and doesn't take up 300k like ALL the other
<hundreds of programs you need. If you have a Mega 2, memory concerns
<aren't as great as us folks with 520's and a meg upgrade.

DISKFREE = 1K
UIS-II = 23K
NEODESK = 28K (shell while an app is running)

While I'm not sure of overhead, these TSRs take < 50K or RAM. I use them on my 1040 (equal to your 520 upgraded) as well as my Mega. Memory is not a problem and no excuse for not getting these codes in lieu of TOS 1.4.

Even when I use MULTIDESK and go way beyond the 128K or RAM for ACCs I have no memory shortages on my 1040 and I run apps like Timeworks DTP, dbMAN, LDW.....

[George Woodside posts a continuation of "Virus 101"]

You mentioned 1 out of 4 e-mail respondents falling in the "you idiot!"
category. Count me, too, you idiot...|-:}

No, your articles don't tell "how to write a virus" in the sense of providing
sample source code, but they certainly present a clear blueprint. You go into
great detail about how viruses can work, where they need to go, how they
overcome obstacles and protections, etc., to the point of naming specific
disk sectors.

You state that a non-programmer won't get anything out of your article, and
that a programmer can easily find this information in "any good computer
book." If that's the case, why post it in the first place? Gimme a break.

Also, keep in mind that comp.sys.mac is uploaded to many, many Mac BBS's
around the country, including underground "outlaw" BBS's populated largely
by high school and college hackers. I know of more than one local BBS of
this type, where you can download virtually every Mac program on the market,
and some people on there would LOVE to get their hands on this kind of
information.

Your articles remind me of a Reader's Digest article I saw some time back
on "How to Protect Your House From Burglars." It was the best article on
"How to burglarize a house" I'd ever seen.

Ron

K&R say nothing about clearing memory. Only static variables are cleared and this is done by the compiler. What K&R say about memory allocated by malloc is that the contents are garbage and that it must be initialize by the programmer.

Anyone programming in C that assumes that malloced memory is zero is making a very big mistake.

So, how will we be able to get TOS 1.4?

Am I going to have to wait for it to show up in a store, or will there be a way for me to get it direct through Atari? With all the confusion there seems to be in this area, I really don't want to have to deal with some partially informed dealer.

490. Re: Federated: Dumped by Atari! Shame on you, Atari!

Newsgroup: comp.sys.atari.st

This is in response to an article condemning Atari for dropping Federated. Atari tried very hard to make Federated a winner, and lost an amount lately estimated as about $100 million in the process. It seems (from what I read in the Wall Street Journal) that 'everyone' in the retail business (but few people in the computer business) knew that Federated was a basket case before Atari bought it. Atari simply doesn't have that much money to lose, so they're getting out while there still is an Atari. They don't exactly make money by doing that, but our enlightened (???) tax laws allow businesses which go from money-losing to money-making to write off their earlier losses against their later profits. At that, it is by no means a certainty that Atari can survive as an independent company (in other words, back to the beginning of the Tramiel era, financially). I have trouble blaming someone for doing everything possible to save the family business.

Source record: 249464

I made one of these (cx22 mods), and here are some experiences I had.
First off, be careful when you solder to the chip. I made a bad connection
and had to re-solder, which resulted in burning out the chip. If I made
another one of these, I would use one of those DIP doohickeys that fit into
the socket, give you a short ribbon cable connected to the pins, and have
a socket on top for the chip.

Second, I would just forget about rewiring the original buttons. It's better
to take the time to install new switches closer to the ball so you can use
the trakball with one hand. I recommend those micro-switches that go "click"
when you push down on them. I've see them at radio-shake for about $1.50
each. With the regular trak ball buttons, you have to put the trakball on
your lap to use both buttons at once.

Last, don't get rid of the original cable. The trakball still works as a
trakball. You can plug the trakball-mouse into the mouse port, and the
trackball-joystick into the joysick port. If you want to use a joysick,
you can stick a port onto the trakball enclosure for that purpose too.

493. News from Cebit '89

Newsgroup: comp.sys.atari.st
Date: 1989-03-15 00:13:37 UTC
From: VBRANDT@DBNUAMA1.BITNET
Message-ID: <8903150013.AA29812@ucbvax.Berkeley.EDU>
Source record: 249465

I asked if anyone was coming to the Cebit '89 at Hannover, West Germany. Well, thanks to the people who responded. Unfortunately, I overestimated the digest turn-around speed, so I had gone before any of the replies reached me.

For that same reason, I guess by the time I write this, a lot of reports from Cebit have come in, but I haven't seen any. So, here are the new things I've seen and heard.

Atari Germany has found a new excuse: TOS 1.4 *is* there, they say, but they don't have ROMs in quantity yet, so they can't officially (!) announce it. They were displaying the new big monocrome screen (SM 129, price as yet undecided), but couldn't demo it, because the screen driver (done by Ken B. & others) needs TOS 1.4 to work, and Atari Germany had *only 2* machines with 1.4 ROMs available in Hannover. That would, for once, confirm that excuse.

I know *I* am going to get TOS 1.4 sometime next week (from where I'd rather not say :-), but if it's really finished, I can't understand why Atari doesn't make a copy available for the general public, so that at least those who own an EPROM burner can make their own ROMs.

The ATW was shown in the new tower-like case, but the demo program looked just like the one they had last September at the Atari Fair in Duesseldorf.

The TT and TT/X *supposedly* will be shown in September at the '89 Atari Fair, again in Duesseldorf.

Lots of new software, but nothing really impressive, except maybe Tempus Word, which is a Tempus-like word processor (available IV/89 for ~ DM 650).

The CD ROM was quoted as "now being shipped to dealers." There was a pre-release of the complete PD collection of the German 'ST Computer' magazine, all on one CD. No price yet.

No new laser printer / postscript emulator etc.

I probably missed a lot. I also got the impression that every Atari person told different stories, so don't be surprised if what I'm saying turns out to be all wrong ... ;-)

494. Re: Running IBM Software on an Atari ST with PC-Ditto

Newsgroup: comp.sys.atari.st
Date: 1989-03-15 02:20:34 UTC
From: adw3345@ultb.UUCP
Message-ID: <444@ultb.UUCP>
Source record: 249466

I own PC-Ditto, which works as adverised. It will run any
software that a run-of-the-mill IBM clone can. I have run several titles
for the IBM and have run into no problems. However, as you might know,
PC-Ditto's only fault is speed. It's no peed deamon, and you may be
shocked to see it kludge along after using a 12mz IBM machine.
I got it as a gift, and I don;t use it much. Unless you already
have lots of IBM software and no IBM machine to run it on would I
reccomend you getting PC Ditto. It works, but it's no subsitute for a
actual IBM.
I have found lots of software, PD or otherwise, that suits my
needs for the Atari, so there is not a lot of IBM software that I find
essential to have.
However, as you can get it for a mere $65 if you shop right, it
is an interesting hack and is fun to show to your friends (See what my
St can do?).

All ST and MEGA product will and can take TOS 1.4

You will probably see two chip sets: 1) a 6 chip set for machines that
use 6 ROM chips for TOS. 2) a 2 chip set for machines that use 2 ROM
chips for TOS.

498. Re: Virus 101 - Chapter 1

Newsgroup: comp.sys.atari.st
Date: 1989-03-15 04:34:36 UTC
From: csrobe@ICASE.EDU
Message-ID: <8903150434.AA22458@icase.edu>
Source record: 249470

Before you take this as gospel...

>Some basic terms, as they have come to be used in this area:

>A VIRUS is any program which spreads itself secretly. It may be
>destructive, a prank, or even intended to be helpful, but it spreads.

>A TROJAN HORSE is a program which executes one function secretly while
>appearing to be accomplishing some other task, or appearing to be some
>other program entirely. One task a Trojan Horse may accomplish is to
>install a virus, which would then spread itself.

>A WORM is a program or function which imbeds itself inside another
>program, be it an application, part of a system, a library or
>whatever. It may or may not spread itself by some means, and may or
>may not have destructive intents.

Take a look at these definitions from Eugene H. Spafford's tech report
CSD-TR-823 "The Internet Worm Program: An Analysis":

Members of the press have used the term 'virus', possibly becuase their
experience to date has been only with that form of security problem.
This usage has been reinforced by quotes from computer managers and
programmers also unfamiliar with the terminology. For purposes of
clarifying the terminology, let me define the difference between these
two terms and give some citations to their origins:

A 'worm' is a program that can run by itself and can propagate
a fully working version of itself to other machines. It is derived
from the word 'tapeworm', a parasitic organism that lives inside
a host and saps its resources to maintain itself.

A 'virus' is a piece of code that adds itself to other programs,
including operating systems. It cannot run independently -- it
requires that its 'host' program be run to activate it. As such,
it has a clear analog to biological viruses -- those viruses are
not considered alive in the usual sense; instead, they invade host
cells and corrupt them, causing them to produce new viruses.

The program that was loosed on the Internet was clearly a worm.

The concept of a worm program that spreads itself from machine to machine
was apparently first described by John Brunner in 1975 in his classic science
fiction novel _The_Shockwave_Rider_. [....]

The first use of the word 'virus' (to my knowledge) to describe something that
infects a computer was by David Gerrold in his science fiction short stories
about the G.O.D. machine. These stories were later combined and expanded to

form a book _When_Charlie_Was_One_. [....]

Just thought I'd try to clarify things, a bit.
cheers,
-c

499. Federated store in Bay area

Newsgroup: comp.sys.atari.st
Date: 1989-03-15 04:40:12 UTC
From: #FJMORA@WMMVS.BITNET
Message-ID: <8903151702.AA18381@ucbvax.Berkeley.EDU>
Source record: 249471

I just visited the Federated store in Seramonte, CA (near San Francisco).
It is quite large (5000 sq. feet or so) and contains almost every 8- or
16-bit computer unit or peripheral ever made by Atari. I noticed some
Megas with a laser printer and shelves with lots of ST applications.
Also, I noticed some labels with Amiga prices on the Mega tables!
Some Amigas were sold here recently... The store was open until 9PM
and the salesperson was quite informative. The Megafile 30 hard disk
was available, although at the outrageous price of $799! And that's
for an RLL 30 Mbyte, 65 ms average access time drive! Why, I saw
it advertised at General Computers in Paris for about the same price (without
the infamous French sales tax overhead). It it possible to get a hard disk
controller and a similar drive mechanism for $500 to $600 in the MSDOS
world, though it is getting really hard to find a mechanism as slow as
this one. I keep thinking that this price is a rip-off. Does anybody
know a retailer carrying the Megafile 30 at a reasonable price?
Thanks.

Date: 1989-03-15 05:32:23 UTC
From: humtech@ucschu.ucsc.edu
Message-ID: <6686@saturn.ucsc.edu>
Source record: 249473

Hello. I just bought a Seagate ST296N hard disk. I'm currently waiting for my ICD host adapter before I can actually use the drive. I had a few questions before I got into using the drive.

First, this is a 80meg drive. I have heard that the current versio of TOS only supports hard drives up to 16meg. I assume that would mean that I would have to create 5 partitions of my hard disk to use the 80megs. Is there some work around for this - some program that fixes this problem? (I assume that TOS 1.4 doesn't have this problem, but then it may be quite some time before I see that.) Is there something else that I'm missing?

Second, are there any programs that people consider to be vital to have on their hard disk? I've heard about speedup programs - are they any good?

Third, and lastly, the Mac has a program called Disk Express (and maybe others) that will attempt to cleanup any file fragmentation on the disk. Is there any such beastie on the ST?

Thanx for your help.

505. Format of 'bad sector list' of HDX 2.0 ?

Newsgroup: comp.sys.atari.st
Date: 1989-03-15 15:00:50 UTC
From: felner@inf.ethz.ch
Message-ID: <104@inf.ethz.ch>
Source record: 249477

I just added a new harddisk to my selfbuilt harddisk-kit. The disk has some hard errors on the media as indicated on the cover of the disk. To map them out, I formatted it with the HDX 2.0 from Atari, which has a Markbad facility that generates a bad sector list (BSL). However, it didn't find all hard errors, and after running 'Markbad' a few times, I got several different BSLs. Two entries at the end of the bootblock indicate the first sector and the number of contiguous sectors holding the BSL. The BSL looks like this (3 real examples):

```
000002 550000 002DC8 002D2C ( 2 bad sectors )

000003 AB0000 002DC8 002D2C 0003A6 ( a 3rd bad sector )

000003 030000 00123F 002DC8 002D2C ( different ordering and
another bad sector)
```

It seems that the first entry indicates the number of bad sectors, and the third, forth, ... hold the number of the bad sectors. But what does the second entry mean ? Is it a checksum ? How to get it ???
Since this is the format used by Atari, I guess it will be 'official'.

If I know what the second entry means, I can build the BSL by hand, adding the bad sectors not found by the formatter (you never know !).

But how about handling that BSL. Does the TOS or any driver support it or even look at it ? Any comments ? Atari ?

Or even better: the format-command of the Adaptec 4000 controller supports adding a BSL, so that the bad sectors are mapped out at format-time. Doing so, you don't have to worry about them any more, because they are not accessible. Is there any formatter around that accepts such a BSL as parameter ?

BTW, how did you, netlanders, map out bad sectors before (or now) ? I was lucky not to have any bad sectors on my other harddisk so far.

- Tomas

506. TOS 1.4? WHY?

Newsgroup: comp.sys.atari.st
Date: 1989-03-15 15:01:35 UTC

507. Use of Objc_Edit function.

Newsgroup: comp.sys.atari.st
Date: 1989-03-15 15:30:17 UTC
From: wkk@cbnewsl.ATT.COM
Message-ID: <264@cbnewsl.ATT.COM>
Source record: 249479

I have been trying to write my own code for handling editing
an editble field in an object. The code below is my test case.
The resource file and its associated editable objects work correctly if
I call the standard "form_do()" routine, so I don't think that resource
file is the problem.

When the code runs it draws the object correctly
and the first call the objc_edit turns on the text cursor at the END of
the editable field define of object EDIT1. However, subsequent calls
to objc_edit with the EDCHAR flag produces no results other than to toggle
the cursor on and off. I have not checked to see if EDCHAR is defined
correctly, but I will do that when I get home tonight. In the
"while" loop, the values of idx and nidx never change, and I believe
that this is incorrect. What am I doing wrong?

BTW: Just in case you want to try this code for yourself, create a dialog
named NAMEDLOG containing an object with an editable field named EDIT1.
Name the resource file resource.rsc.

I am using Laser C version 2.0. Please, someone lift me from my ignorance.

```
#include <gemdefs.h>
#include <obdefs.h>
#include <osbind.h>
#include "resource.h"

char *edit1 = "Test ";

main()
{
OBJECT *dialog;
int idx, nidx;
int chr;
char str[50];

appl_init();

if (!rsrc_load(".\\RESOURCE.RSC")) {
graf_mouse(ARROW, 0x0L);
form_alert(1, "[3][Cannot find|resource.rsc file|Terminating ...][OK]");
exit(1);
}

rsrc_gaddr(0, NAMEDLOG, &dialog);

((TEDINFO *)dialog[EDIT1].ob_spec)->te_ptext = edit1;
((TEDINFO *)dialog[EDIT1].ob_spec)->te_txtlen = 5;
```

```
dialog->ob_x = 50;
dialog->ob_y = 50;

/* draw the object, this works fine */

objc_draw(dialog, 0, 10, 0, 0, 300, 300);

idx = 0;
objc_edit(dialog, EDIT1, 0, &idx, EDINIT, &nidx);
while(1) {
chr = Crawcin(); /* get the next character */
chr &= 0xff; /* mask off the nuaghty bits */
if(chr == 0x0D) exit(1); /* exit if CR */
objc_edit(dialog, EDIT1, chr, &idx, EDCHAR, &nidx); /* no go */
sprintf(str,"[1][idx = %d nidx = %d][EXIT]", idx, nidx);
form_alert(1, str); /* just checking */

}
/* do_dialog(dialog); This works fine */
}
```

Many people are complaining about how this information can be used to write a virus, even tho no code has been given.

FLAME ON!

Grow up People!!

This is the United States of America (at least the message originated here) and the NET is a free network for exchange of information.

If you wanna stifle the free expression and dispersment of information, then jump on the anti-porn bandwagon and join people who don't believe in the BILL OF RIGHTS.

Any hacker worth a damn can disassemble the paultry 483 bytes of information of a virus in the boot sector. Not to mention that the HitchHiker's Guide to the BIOS is also on many pirate boards, and it explicitely states how to write executable boot sectors.

Instead of showing your ignorance and naitivity at the resourcefulness of a hacker, why not just send a letter bomb or something, and get rid of George Woodside. There, I just told you how, are you gonna do it?

Information should be free to all. If you are gonna get offended by it, then press the damn 'N' key, or don't call. You set yourself up to get upset, and when it happens you bitch to everyone. Don't set yourself up, avoid getting upset and everyone will be happier.

FLAME OFF!!

Have a nice day. Thanks for very informative articles.

As one of the authors of DC Formatter, which has 6 executable boot sector options, I am fully aware of how it is done (and even have a single function which will make an executable boot sector out of any code), but I still found the articles enjoyable and very well written.

It is nice to have such good information without having to pay for it.

- mike

None of the above is shared by any of the other personnel at Double Click Software. I alone am the culprit.

509. PARKING HARD DRIVE HEADS from within Spectre 128

Newsgroup: comp.sys.atari.st
Date: 1989-03-15 17:18:15 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <890315.11181436.014024@SFA.CP6>
Source record: 249481

As great (REALLY GREAT!!!) as Spectre 128 is, there is one item missing
that I haven't been able to locate which would complete the product more
than it already is. We need a hard drive parker that can be run from within
Spectre 128.
When I bring the system down, I am always having to reboot the the
"ST part of my computer" so that I can run my head park program. I wish we
had an equivalent program that can run from within Spectre.
I have tried some of the Macintosh PD parkers but, for obvious reasons,
they don't work.
Does anyone know of such a program, if not, could someone, as if they
really had nothing to do, write one and share it? Not asking for much, am I...

Not that I've read it but, you've just supplied an excellent example of how distributing information can be helpful for the *good* people. Probably the best way to learn how to protect yourself from burglars is to learn how they work. A good burglar makes a good security consultant.

By publishing known methods used by computer viruses, people can write software to detect, kill or prevent viruses. Software can be designed to protect itself from infection. I think if you could keep everyone in the dark, we would all be much more vulnerable to infection and less equipped to combat an infection.

515. Re: argv[0] and Sozobon C

Newsgroup: comp.sys.atari.st
Date: 1989-03-15 20:02:06 UTC
From: david@bdt.UUCP
Message-ID: <529@bdt.UUCP>
Source record: 249487

I've seen enough un-truths about this subject already so here is
the story behind argv[0] and MT C-Shell.

First the history that got us here: Way back in 1986 I developed
and released the first version of MT C-Shell V1.0. This was
before MWC, back when the only C compilers were the DRI/Alcyon
package from Atari and Megamax. neither of these implemented
argv[0] handling at the time (they just full it it with some
static string).

MT C-Shell needed more than the 128 bytes that Pexec gives you
for arguments, so I invented a method for passing a larger
number of arguments, using the enviroment space. This was
the first method of extended arguement passing and argv[0]
handling.

Along comes Mark Williams Co. and MWC. They implement another
(incompatible) method for passing argv[0] and extended arguments
also using the enviroment space. Since they're bigger than I
am (and because they're way was probably better than mine anyway)
I adopt MT C-Shell and all my utilities to be compatible with this
newly established argument passing method. At this time Mark
Williams Co., myself, and representatives from Manx and Megamax
approach Atari with the idea of defining a "standard" method for
extended arguments. Since Atari basically said "we don't care
what you do," we simply agreed that the MWC method would be the
de-facto "standard". MT C-Shell Versions 1.10 and above and
Micro C-Shell Versions 2.70 and above use this MWC "standard"
method of argv[0] and extendend argument passing.

The "conversion" programs that are often talked about only apply
to *very* old versions of MT C-Shell and Micro C-Shell (prior to
V1.10 MT and V2.70 Micro C-Shell, or about Fall 1986). Probably
nobody needs these conversion programs anymore; they cloud the
issue.

After all this, many new compilers and libraries have arisen for the
ST. It seems that along with them came some more techniques for
argument passing. MT C-Shell does not support any methods other than
that adopted in 1986 (the MWC format). I do *not* have plans to
implement other methods of argument passing, unless one is *finally*
adopted as the "official" standard.

The method used by MT C-Shell and MWC starts with an environment variable
ARGV, whose value is a "iovector" describing the standard handles.
After this the arguments are appended (each null terminated) starting

with argv[0]. The list of arguments is terminated with a empty
string (a double null), which marks the end of the enviromnent. The
basepage "tail" is also filled with the first 127 bytes of the arguments
in standard TOS Pexec format, without argv[0]. The ARGV variable is
placed after the "real" environment variables and is always followed
by the command arguments.

I do not know if Sozobon C is compatible with this method or not.

517. Re: cartridge port - NO PROBLEMS - on 1040 ST

Newsgroup: comp.sys.atari.st
Date: 1989-03-15 20:52:58 UTC
From: jbww@ukc.ac.uk
Message-ID: <438@harrier.ukc.ac.uk>
Source record: 249489

**** DON'T PANIC ****

O.K., I think I have resolved the problem with using ADC/DAC cartridges
in newer 1040 STs.

------- THE ATARI STs ARE NOT AT FAULT --------

The scenario was : New model 1040 STs, running Fast Basic, including
some assembler code, reading an ADC/DAC chip plugged into the
cartridge port. The `read' just consisted of a straightforward
`read byte at location', with the device bus enabled with not S3.

(Dead simple, nothing to go wrong, ideal for short student projects,
nothing to go wrong ... Ha.)

Students reported that software and hardware that ran fine on an
older ST failed to run with the new ST. Other Basic software ran,
but attemting to read the cartridge failed. I could see nothing
out of the ordinary on the FastBasic disk.

As a news report of similar behaviour on Mega 2s had appeared the
the previous day, it seemed to be a manifestation of the same.
We had just ordered a Mega 2, to be used with our ST to Transputer
Link cartridges, so I was rather eager to nail this problem ....

So -

Students were back in the Project Lab. today, so I was able to get them to
try an idea that come to me over the weekend - the students here have become
a bit worried over a virus that they have found on a few of the boot disks
for general use, and usually boot with a virus checker, a mouse accellerator
- AND TURBODOS !

When I checked with them, they said yes, they probably had ....

anyway, *** booting a clean system has resolved the problem ***

Quite clearly trying to patch a different (and at least partially
fixed OS) is NOT the right thing to do. I have since heard that
some 1040 STs are getting the 1.2 ROMS from the Mega STs. (Thanks to
Ken Badertscher, Roy Good for very prompt response on the later.)

Sorry to frighten so many people (as well as my self), but with
these cartridge add-ons the Atari STs are becoming rather useful in
the Lab. (although I would like to make more use of their DMA port).

P.S. the write technique I use is a common one that has been round a while,
both on the news net and in magazines (I couple of days ago I just happened

to come across a Byte article that mentioned a variant of the method - Byte, June 1987, P161). Simply, any read of a certain range of addresses causes the lower bits of the address to be latched and presented as data to the peripheral - take care A8-A1, or A7-A1,UDS. Anyway, the above non-problem was for just standard reads.

J.B. Webber jbww@ukc.ac.uk

P.P.S. Any information anyone has on the DMA port would be of great use. I have some, but it does not always agree with itself or with what a logic analyser tells me.

518. Re: TOS 1.4 vs NEODESK and UIS-II

Newsgroup: comp.sys.atari.st
Date: 1989-03-15 21:06:36 UTC
From: clf3678@ultb.UUCP
Message-ID: <446@ultb.UUCP>
Source record: 249490

When I said "300k", I was being a bit sarcastic.

Still, I would rather have TOS 1.4 and all the free RAM I can get than have to sacrifice memory for programs like UIS and NEODESK.

I also don't understand how you can say that NeoDesk only uses 28k. My understanding is that it uses 128k or so. Maybe I'm wrong because I never had any interest in the program.

What about the other programs to fix the 40 file folder limit, the time stamp fix, etc? Those add up.

=cf=

519. Atari 8-bit System for sale

Newsgroup: comp.sys.atari.st
Date: 1989-03-15 22:17:48 UTC
From: ajy2208@ultb.UUCP
Message-ID: <448@ultb.UUCP>
Source record: 249491
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st,wny.general,misc.forsale,ny.general

I've got the following system for sale due to the fact that I need money
for school. I would like to sell the system as a whole, as it might take
me a while to sell the entire system as individual pieces. Anyway,
everything works really well together! Here's the system:

Items
==========
Atari 130XE Computer, 128K RAM & Rev. C BASIC built in
ICD Multi Input/Output board
- RS232 (modem) port
- Centronics (printer) port
- SCSI/SASI (hard drive) port
- Firmware, and Printer Spooler
- 1 MEG RAM (fantastic Ramdisk!!!)
XE Adaptor for MIO (necessary to use MIO with XE)
Adaptec 4000A Hard Drive Controller Card
Seagate ST225 20 Meg hard drive
Microscience 20 Meg hard drive
Indus GT Double Density disk drive
Atari 1050 w/US Doubler (Double Density)
XEP80 80 column board (also has printer port)
R-Time 8 battery clock cartridge
SpartaDOS X Cartridge
Assembler Editor Cart
PC Power supply (150 watts) for the 2 hard drives & Adaptec
XT Case (two hard drives, Adaptec, MIO, & Power supply all fit here!)
Magnavox 80 column Monochrome Monitor (works great with XEP80)
100 Disks in 3 Alsop disk cases (including)
Hacker
Archon II: Adept
Omnitrend's Universe
Alternate Reality: The Dungeon
Spy Vs. Spy
Carina II BBS Software
20 Original Antic disks, in 2 plastic disk cases
Cables (HD cables, RS232 [modem] cable, etc.)
Power Strip
==========

I am willing to part with this system for a mere $1500. A lot of my time
and money (well over $2000) went into putting this system together.
The hard drives and the 1 MEG MIO board alone would cost nearly $1000 today
new! (each drive is roughly $200, and ICD sells the MIO for $450)

I've got all the cables and power supplies needed to hook everything together. The two hard drives have a TON of PD software on them, as I used to run a Bulletin Board System. I also have a lot of original software on the 100 or so disks mentioned above.

If you are looking to run a BBS, this is a great way to start. I ran Carina II and in my opinion it is better than any ST BBS software that has come out yet (including FoReM).

With a second monitor (or b/w TV) you can generate two entirely different displays by using the XEP80 and SpartaDOS X. I'll be glad to assist the person who purchases the system in setting it up, and if he/she is local, can do so in person. If you're not local to me, I'm going to have fun mailing all this!!

Please contact me at 716-475-4088 weeknights or weekends if you are interested in purchasing this system. Or, you can reach me at:

ajy2208@ritvax.bitnet - Bitnet
ajy2208@ultb.rit.edu - Usenet

I sincerely hope the source is Atari GmbH. If not, you will have copies of
either the very early "Beta" version, or unofficial PROMs derived from the
Developer softloaded release of 8/88. Either way, you will have a version
which still contains errors, unless you get the latest version via GmbH.

Hah! When the first developers release of 1.4 came out last August they
used the very same excuse to tell the people the 1.4 will not be
available before December.
Do they still want me to believe this....

>were displaying the new big monocrome screen (SM 129, price as yet undecided),
>but couldn't demo it, because the screen driver (done by Ken B. & others) needs
>TOS 1.4 to work, and Atari Germany had *only 2* machines with 1.4 ROMs avail-
>able in Hannover. That would, for once, confirm that excuse.

Huh, Huh, Huh, There are also disk based versions of 1.4 (you'll only
need 1 copy to boot any number of machines). Furthermore if a company
like Atari cannot burn a few Eproms for a large fair, what are they up to??
>
> I know *I* am going to get TOS 1.4 sometime next week (from where I'd rather
>not say :-), but if it's really finished, I can't understand why Atari doesn't
>make a copy available for the general public, so that at least those who own an
>EPROM burner can make their own ROMs.

Agree!! Anyway, if systems with new ROMs hit the shop before there are
upgrade kits a lot of people will burn their own roms.
(Thats how I got my Mega Roms)
>
> The TT and TT/X *supposedly* will be shown in September at the '89 Atari
>Fair, again in Duesseldorf.

Ough. I cannot keep from laughing. This thing has been promised to be
available very soon now for three years. Giggle.
I could have developed a TT alone in that time.
>

>Bitnet: VBRANDT@DBNUAMA1 Volker A. Brandt
>UUCP: ...!unido!DBNUAMA1.bitnet!vbrandt Angewandte Mathematik
>ARPAnet: VBRANDT%DBNUAMA1.BITNET@CUNYVM.CUNY.EDU (Bonn, West Germany)

Once again thanks Volker.

Does this Atari company really wants us to believe anything they say.
They can only tell the same promises and excuses again and again.

Nay, my ST is a fine machine, and I'm still happy I bought it, but I
would not rely on Atari info any more. Seeing is believing as far as
Atari concerns. Where are the long ago promised blitter upgrades for 1040
owners???

PS: One major advantage of the ST: It runs MINIX!
No more single tasking. Unix is here.

525. The Calamus Program

Newsgroup: comp.sys.atari.st
Date: 1989-03-16 08:53:52 UTC
From: jansteen@cwi.nl
Message-ID: <504@turing.cwi.nl>
Source record: 249497

We are planning to use a:

- Mega 4ST
- SLM 804 Laserprinter
- Megafile 30 Harddisk
- Calamus DTP program

configuration to make a bi-monthly 48 pages magazine.

Concerning the Calamus program we have a couple of questions:

- Does the Calamus program have a build-in
hyphenation-algorithm?

- Does Calamus support superscripts and subscript?

- What problems (limitations) did occur while working
with the Calamus program?

From article <1387@atari.UUCP>, by danscott@atari.UUCP (Dan Scott):
>
> Sorry, but TOS 1.4 will only be supported in ROM form only. That means
> no EPROMS or RAM based versions will be suppored by Atari.
>
> This is due in part to the large number of RAM revisions that left Atari for
> developer testing and the number of pirated EPROMs available off those RAM
> versions.
>
Hmm. Given Atari's previous record of not getting products out
the door quickly, it would seem that the 'pirated' EPROMs of TOS
1.4 are a sensible precaution on the part of well-equipped users
who want to use the improved OS before 1992.

I would have thought that allowing dealers and others to
duplicate TOS 1.4 would be a quick way of getting it out to the
people who need it, and one which would reduce Atari's expenses.
Surely Atari isn't planning to make lots of money out of the
upgrade??

Admittedly, there is a danger that nasty people might try to sell
or give away EPROMs that they'd modified in some manner, and I
can see that Atari wouldn't like to have to carry the can for
subsequent complaints. What do you all think is the right way to
balance our wishes to get the upgrade as soon as possible with
Atari's justifiable desire to retain some control over what gets
out?

Has anyone come up with a GIF -> Spectrum-512 or .RAW file (ray-traced output file format) -> Spectrum-512 converter? I've seen code posted to the net to display Spectrum pics, but no translators yet.

528. problems with pd midi software

Newsgroup: comp.sys.atari.st
Date: 1989-03-16 14:23:25 UTC
From: HIGGS_M@prime1.lancashire-poly.ac.UK
Message-ID: <8903161436.AA22054@ucbvax.Berkeley.EDU>
Source record: 249500

I have now managed to get through to ssyx satisfactorily, thanks to all
who sent help.
I have uploaded the d110 and the mt32 midi software (patch editors) and
find that both of the binaries seem to contain the same files i.e. for the mt32
editor although the docs included are for the correct one. i.e..

the mt32 contains the mt32 binary and documentation and the d110 contains
the mt32 binary and the d110 documentation.

Does anybody know why? Any help would be appreciated.
Thanks in advance.

The real criterion for publishing potentially damaging information should
be "Will it do more harm than good?" I freely share information about
viruses on a 1-1 basis, where I can have the opportunity to make a judgement
about the person I am imparting the information to. But I would never do
it in a news posting, because in that venue, I have no ability to judge
the motivation of individual readers.

The problem with Virus 101 postings is that they went into a level of
detail greater than required by the average reader. So the audience
consisted of three groups (in order of size).

* casual readers, who might like to know, but are not going to use
the information.
* people who already knew most or all of this stuff anyway.
* people who might potentially misuse it.
* people who have a legitimate need for this information.

The real target for the in-depth info in the postings was the last one.
The question is, was "broadcasting" the way to get this information
to them, given the potentially larger group of misusers?

>By publishing known methods used by computer viruses, people can write
>software to detect, kill or prevent viruses. Software can be designed
>to protect itself from infection. I think if you could keep everyone
>in the dark, we would all be much more vulnerable to infection and
>less equipped to combat an infection.

Everyone needs to know about Viruses. They need to know how, _in_general_,
viruses work. They _dont_ need to know about the cute infection vector
used by the XYZ virus.

People already have written tools to detect, kill and prevent viruses (I
being one of those people). Anyone interested in learning how to do this
can get the technical information required quite easily through non
"publishing" channels.

Anyone writing software can _detect_ that they have been infected in about
20 lines of code (on the Mac, at least). Just keep a record of the size
and contents (simple checksum) of each of your code bearing segments (CODE,
INIT, etc). Check them each time you boot; if they have changed, or a new
resource has appeared, warn the user that a virus is in his program.

See - I just disseminated some information responsibly. ;^)

Same problem here and same solution; it must be a problem with UNITERM,
because I do not have the problem with other kermits. I once sent a mail
about this to Simon Poole, but got no answer (but then, our mailer didn't
work properly at that time).
My version of UNITERM is 2.0d; maybe this helps

Radio Shack has a serial mouse for $49.00 that has a great feel to it. It fits the hand much better than the ST mouse and the buttons aren't as stiff. However, I think before I change from the Atari mouse that I'd like to get an optical one but admit not knowing if it would work or not. At any rate, I notice that the Radio Shack mouse does not have the same pin configuration as the Microsoft one. In fact, it is only using five of the nine pins that are available on its connector.
Jeff Beadles, I've tried replying to your message in which you explained the mouse setup but my messages keep bouncing back. SIGH. We are needing to use SERIAL mice, right?

From: Jim McCabe MCCABE at MTUS5
To: INFO-ATARI16 at SCORE.STANFORD.EDU
Subject: MX2 and DC-Port

Wowzers -- I just read the docs for MX2 and I'm extremely impressed!! Fred sure added a lot since his earlier versions.

Anyway, one of the niftiest features is MX2's ability to use custom device drivers for each process. Fortunately, there are four extra device drivers that are available -- isn't that the number of extra serial ports available on DC-Port?

My question is this: Are any device drivers available for DC-Port under MX2? Will DC-Port even work with MX2?

Finally, I've got one more question that doesn't relate to MX2 necessarily. How easy is it to poll the carrier on each port? Also, how easy is it to control the DTR lines?

Thanks in advance!

Jim McCabe

> employees in the future!

I totally disagree with the above writer. Atari has made the best possible
decision in dumping FG. I live in anarea with many FG stores (Phoenix,AZ)
and those store are all losers. I don't shop there because of poor prices,
rotten customer service, and poor selection. Atari tried to turn the stores arounds.
Atari eeven made one of the FG stores into a model ST COMPUTER STORE and even
that didn't help improve sales much. Also, the few local independent Atari
stores (COMPUTER WORKS in Glendale AZ) were being hurt by Atari's pricing
with regards to FG stores. FG stores got the 520STFM (the one with the double
sided floppy drive) weeks before COMPUTER WORKS got them. That really made the
COMPUTER WORKS store owner mad!!!

I am certain that Atari tried to find someone to buy FG, but probably couldn't
find any takers.

Now that Atari si out of the retail sale business maybe Atari will have some
money to spend on finishing the 68030 machine, and getting the Laptop ST out.

By the way, Atari is now shipping the SLM804-PCV which is the old SLM-804
laser printer bundled with the Imagen ULTRASCIPT postscipt language. I would
recommend buying a Mega ST4 if you plan on using it though!! But, that is VERY
good news for us Atarians!! And Calamus is setting the DTP amrket on fire, it
is that good!!

Well, anyway, I for one approve of Atari's decision to dump FG stores. and
I jhope that Atari can recover from its $200 Million Dollar mistake!!!!

I am also currently looking for a .GIF viewer for the ST... is here such
a thing?

I also would like a program that would SAVE files in either .MAC or .IFF (.GIF)
format... picswitch loads .IFF (not .GIF) but it will only convert to ST
formats... this is nice-- but incomplete.

>Federated employees, nobody knows what Atari can do to Atari
>employees in the future!

What a strange point of view. You have much to learn about the
business world.

Businesses exist to make money. Any publicly-held corporation (such
as Atari Corp.) has an obligation to make a profit for its
stockholders. Atari's management would be grossly negligent if they
retained Federated until its cash drain pulled the whole of the
corporation into bankruptcy.

Is this what you are advocating?

That would certainly result in the loss of the jobs of not only
Federated employees, but Atari Corp. employees as well, plus the loss
of the investments of Atari's stockholders, not to mention the effect
on all of the Atari dealers and owners.

Furthermore, there is no certainty that "Federated is left to die on
its own". It will be sold (if a buyer can be found). The new buyer
can inject sufficient cash into the company to keep it afloat, while
it rebuilds it from within. The "death" of Federated is by no means
certain.

I would like to congratulate Atari for making a sound business
decision. The only question is, "Why did Atari buy Federated in the
first place, when many independent observers said it was a bad deal?"

537. Random Number Generator for OSS PP

Newsgroup: comp.sys.atari.st
Date: 1989-03-16 18:09:13 UTC
From: csrobe@ICASE.EDU
Message-ID: <8903161809.AA00227@icase.edu>
Source record: 249310

Here are 2 code fragments for an excellent Random Number generator written by Dr. Steve Park of William and Mary. For more information, see "Random Number Generators: Good Ones are Hard to Find", in the October 1988 issue of _Communications_of_The_ACM_.

```
s : integer; { stream index }
seed : array [0..255] of real;

{* This file should be used on systems that only have 16-bit integers *}

function Random : real;
const
a = 16807.0;
m = 2147483647.0;
q = 127773.0; { m div a }
r = 2836.0; { m mod a }
var
lo, hi, test : real;
begin
if (s > 0) then
begin
hi := trunc(seed[s] / q);
lo := seed[s] - q * hi;
test := a * lo - r * hi;
if test > 0.0 then
seed[s] := test
else
seed[s] := test + m;
Random := seed[s] / m
end
else
Random := 0.5
end; { Random }

procedure Plant_Seeds; { a private procedure which is }
const { used to "plant" a sequence of }
a = 8350.0; { seeds seperated one from the }
m = 2147483647.0; { next by 8,016,548 steps }
q = 257183.0; { m div a }
r = 5597.0; { m mod a }
var
j : integer;
lo, hi, test : real;
begin
for j := 2 to 255 do
```

```
begin
hi := trunc(seed[j - 1] / q);
lo := seed[j - 1] - q * hi;
test := a * lo - r * hi;
if test > 0.0 then
seed[j] := test
else
seed[j] := test + m
end
end; { Plant_Seeds }

{*}

procedure Randomize;
var
t : integer; { 32-bit 2's compliment integer }
begin
repeat
writeln;
write('Enter a positive integer seed (9 digits or less) >> ');
readln(t)
until (0 < t) and (t < 2147483647);
writeln;
seed[1] := t; { this is seed[1] - now }
Plant_Seeds { plant the other seeds }
end; { Randomize }

procedure Select_Stream(stream : integer);
begin
s := stream
end; { Select_Stream }

{ end implementation }

procedure init_rngs;
begin { initialize }

s := 1; { supply a default stream }
seed[s] := 123456789.0; { and an initial seed }
Plant_Seeds

end; { end initialize }

------------------------------------------------------------------------
s : integer; { stream index }
seed : array [0..255] of integer;

{* This file should be used on systems that has 32-bit integers or larger *}

function Random : real;
const
a = 16807;
m = 2147483647;
```

```
q = 127773; { m div a }
r = 2836; { m mod a }
var
lo, hi, test : integer;
begin
if (s > 0) then
begin
hi := trunc(seed[s] / q);
lo := seed[s] - q * hi;
test := a * lo - r * hi;
if test > 0.0 then
seed[s] := test
else
seed[s] := test + m;
Random := seed[s] / m
end
else
Random := 0.5
end; { Random }

procedure Plant_Seeds; { a private procedure which is }
const { used to "plant" a sequence of }
a = 8350; { seeds seperated one from the }
m = 2147483647; { next by 8,016,548 steps }
q = 257183; { m div a }
r = 5597; { m mod a }
var
j : integer;
lo, hi, test : integer;
begin
for j := 2 to 255 do
begin
hi := trunc(seed[j - 1] / q);
lo := seed[j - 1] - q * hi;
test := a * lo - r * hi;
if test > 0.0 then
seed[j] := test
else
seed[j] := test + m
end
end; { Plant_Seeds }

{*}

procedure Randomize;
var
t : integer; { 32-bit 2's compliment integer }
begin
repeat
writeln;
write('Enter a positive integer seed (9 digits or less) >> ');
```

```
readln(t)
until (0 < t) and (t < 2147483647);
writeln;
seed[1] := t; { this is seed[1] - now }
Plant_Seeds { plant the other seeds }
end; { Randomize }

procedure Select_Stream(stream : integer);
begin
s := stream
end; { Select_Stream }

{ end implementation }

procedure init_rngs;
begin { initialize }

s := 1; { supply a default stream }
seed[s] := 123456789; { and an initial seed }
Plant_Seeds

end; { end initialize }
```

I know that this generator works under OSS Personal Pascal, because I've used it.

Enjoy,

538. The PC7 Archive

Newsgroup: comp.sys.atari.st
Date: 1989-03-16 18:29:31 UTC
From: dyer@math.lsa.umich.edu
Message-ID: <592@stag.math.lsa.umich.edu>
Source record: 249311

A few months ago, I posted this to help out the people who were
having trouble accessing our archive. This is a revised version.
If you can already get files from us, then this article is
pretty much pointless for you.

Presenting....

Jon Brode's PC7 Cookbook

The PC7 archive is stored on an IBM 3090-600e mainframe. It uses an
ugly, awful, old operating system called MTS. It doesn't like talking to
un*x machines and such, as a matter of fact it couldn't until our systems
group installed the HIM, the host interface machine. We have two of them,
but only the first one is available for anonymous ftp. This ugly little
kludge has been just recently installed, thus it is still buggy. If you
have trouble connecting or trouble with dropped connections, that's what's
wrong. When that happens, try again later when the HIM is in a better mood.

We used to run this archive on Clio and Euterpe. They were Suns and
performed ftp transactions relatively well. We outgrew those machines
so we had to transfer external archive retrievals to the 3090. (the
archive was always available on the 3090 for local users) Rumor has it
that we will be moving back to some Suns, but that may be a few months
off.

You can only access PC7 (the name of the archive) if you have ftp. We'd
like to set up mail access, but we're having some problems with that. Anyway,
if you have ftp, type 'ftp him1.cc.umich.edu' or 'ftp 35.1.1.43', some
systems prefer one over the other, but they both get you to the same place.
Once you are connected, our system will prompt you for a name. Type
'anonymous'. Then you will be prompted for a password. Type whatever you
want, its not picky. Then you will be given a nice 'ftp>' prompt.
Congratulations! You have just entered the realm of MTS. (the him1
name will be going away soon, but it still works. the new name will
be posted as soon as it goes into effect)

That will put you in the directory of the FTP account. There's nothing
there, so you will have to change to the PC7 directory. Type 'cd pc7:'. That
will put you in our directory. Actually, directory is a misleading term
because MTS doesn't have a hierarchical filing system, thus all of our files
are clumped together into one huge mass. We don't like it either, but there's
nothing we can do about it. If you want to see all of the files that we have,
type 'ls ?'. Note: MTS uses a ? as a wildcard, not a *. This will flood
your screen with filenames. To get a more manageable listing, use a prefix
with the wildcard characters. For example, 'ls disk?' lists all of the
filenames that start off with the letters 'disk'.

Unfortunately, our mainframe limits us to 12 character filenames, which means that they aren't all that descriptive, but luckily allows us to name them with ST compatible names. If you want to find out what the files are, you could read the '!index' file. The only problem is that it is pitifully out of date. I would like to get it updated soon, but I just don't have the copious amounts of spare time that I once did. Until I find the time to update the index, you'll have to try to determine what the programs are by the filename. Incidentally, this file is not binary, do not try to transfer it as such. Expect an update in May.

And now, the fun part, how to get our files down to your local system. After you've 'cd'ed to PC7, and found the file you want to get, type 'binary'. This will let you transfer the arc files properly. You *must* set binary when you ftp arc files. To get the file you want, type 'get filename', where filename is the name of the file you want. Then you can sit back and wait for the transfer to complete. There is a command called 'mget' to let you get multiple files. Remember when you use it that the MTS wildcard is ?, not *. Some ftp implementations have a 'hash' command that lets you know how much has transfered. Other ftp implementations have a 'bell' command that beeps at you when your transfer is complete.

Now comes the tough part, transfering the file to your ST. There are many, many ways to do this. The most popular seems to be kermit, so I'll describe how to use Uniterm's kermit. Ask your local sysadmin how to run kermit. Then, make sure that you have parity and stop bits set properly on both sides. If they aren't, you'll get bad CHK's and other nasty errors. After that, type 'set file type binary'. (On VMS systems, you have to set file type fixed, instead of binary) Then type 'send filename', and things should be set on that side. From Uniterm, hit Alt-T and click the box that says binary. Then click the box that says 'receive' and supply the fsel box with a filename. From there you can sit back and relax again.

Once you have the file on your ST, you have to unarc it. Most of the files on PC7 were arced with the old version of arc, but a lot of the newer stuff is done with the new version. To unarc the old stuff, use dcopy, to unarc the new stuff use arc 5.21b. Arc 5.21b will unarc the old stuff too, but dcopy is *much* faster.

That just about wraps it up, folks. If you have anymore problems, send me some e-mail. If you want to say hello, send me some e-mail. If you want to compliment the fine job (IMHO) that I'm doing, send me some e-mail. If you want to flame me or complain, I'll give your name to my father, the IRS auditor. :-)

Jon Brode -- dyer@math.lsa.umich.edu usercptb@umichub.BITNET
Moderator of PC7, Atari-God :-)

539. netste.arc on HIM1

Newsgroup: comp.sys.atari.st

541. MWC CSD is ticking me off!

Newsgroup: comp.sys.atari.st
Date: 1989-03-16 18:33:52 UTC
From: csrobe@ICASE.EDU
Message-ID: <8903161833.AA00429@icase.edu>
Source record: 249314

I am trying to use CSD with MWC and not only am I prevented from running CSD from my favorite shell (Gulam)! but it keeps craping out on me! I am still working on UUPC and I want to set a tracepoint on a line of code in dcpsys.c. First I use F1 to search for a string that I know is in dcpsys.c (I can't find it listed how to go straight to a particular file -- Personally, I think the documentation is the worst that I have seen come out of MWC!!!). After I find the string I used F3 to set a tracepoint. Now when I run it, either using F4 ^<- (reload and restart) or F4 F3 (run tracepoint), the thing bombs with "Can't open dcpsys.c".

Obviously, MWC CSD opened dcpsys to set the tracepoint but what I can't understand is why isn't it closing it? Am I doing somthing wrong or is my furor justifiably aimed at MWC! I generally like their compiler but this has got me pissed to no end. I already dislike MSH and I've had some complaints about their MAKE system, If crap likes this keeps up, I'm going to dump the whole system, buy a PC, and use the Borland systems! Why can't we have a debugger as nice as theirs! D*mnit, its better than dbxtool on the Sun!!!

Can somebody help me!?! Pleeeeeeeaaaaaaaaaasssssssssseeeeeeeeeeeeee!

542. Announcement: New electronic music list (MIDI,Synthesizers,Micros)

Newsgroup: comp.sys.atari.st
Date: 1989-03-16 18:51:00 UTC
From: CADS_COLE@GALLUA.BITNET
Message-ID: <8903162322.AA19167@ucbvax.Berkeley.EDU>
Source record: 249315

Date sent: 16-MAR-1989 13:48:21

There's a new list for those of you who like to play with synthesizers and micros. It's been up for about a month now, and I'm helping the moderator get the word out about it. Here's the info:

EMUSIC-L@AUVM.BITNET (and EMUSIC-D@AUVM.BITNET)

EMUSIC is a complementary pair of lists (EMUSIC-L for undigested mail, EMUSIC-D for the moderately edited digest) devoted to the discussion of Electronic Music.

Topics of interest include (but are not limited to): synthesis methods, algorithmic composition, psychoacoustics, timbral research, instrument design, MIDI troubleshooting, new tricks for old machines, musique concrete, pedagogic methods, performance techniques, reviews of current and historical musical and technical trends, announcements of events, papers, homegrown sounds and software.

The EMUSIC-D FILELIST contains the archive of the discussions to date as well as data files, programs and other materials of interest to the Elec-tronic Music community.

To add yourself to the list, send the command
SUBSCRIBE EMUSIC-L Your_Full_Name (for undigested mail)
or
SUBSCRIBE EMUSIC-D Your_Full_Name (for digested mail)
via mail to LISTSERV@AUVM.BITNET or LISTSERV%AUVM.BITNET@CUNYVM.CUNY.EDU (Internet) where Your_Full_Name is your real name (not your userid). To remove yourself from the list send the command
SIGNOFF EMUSIC-L (or SIGNOFF EMUSIC-D)

Moderator: Eric Harnden <EHARNDEN@AUVM.BITNET>

Enjoy!

543. Spectre and Viruses

Newsgroup: comp.sys.atari.st
Date: 1989-03-16 19:03:51 UTC
From: LMD101@PSUVM.BITNET
Message-ID: <76430LMD101@PSUVM>
Source record: 249316

Hi Everybody,
I'm thinking of getting spectre 128 soon, and I was wondering if
anyone has encountered some of the many mac viruses while using spectre.
I've seen a lot of the mac viruses at work, but I was wondering if they would
function any differently in spectre.

Thanks,
Matt Day(lmd101@psuvm.bitnet)

[... stuff deleted...]

rsrc_load("d:\workshop\fred.rsc");

[...more stuff deleted...]

Hmmm... this may not be the cause of your problem, but the fact
that the ST uses the "\" character in path-names has always created
problems for me-- escpecially when coding in C (what else would you use? :-)
The above line SHOULD be:

rsrc_load ("d:\\workshop\\fred.rsc");

(I assume that your message was verbatim from the actual code)

546. Re: MWC CSD running on top of Gulam

Newsgroup: comp.sys.atari.st
Date: 1989-03-16 21:53:40 UTC
From: andyc@hplsla.HP.COM
Message-ID: <5440016@hplsla.HP.COM>
Source record: 249319

Chip Roberson writes:

| Well, I love MWC and I'm thankful for CSD, but I hate MSH so I use Gulam --
| in fact I really like Gulam (even though I seem to bomb it when in emacs
| from time to time).
|
| Anyway, I've got a problem, csd won't load completely when executed from
| gulam! I get the copyright message, the it says "Reading tables...",
| and then it reads some source files ("Adding source: <filename>.c").
| Then when it tries "Loading <pgm>.ttp" I get:
|
| exit status -33
| Fatal error: execute failed: {NULL}
|
| -33 = File not found.
|
| however, if I exit Gulam and run msh, it works! Now I don't want to
| keep bouncing back and forth between Gulam and msh and I won't do my
| development in msh! Does anybody know how to fix this?
|

I've observed exactly the same problem. My first guess was that the path
I defined for Gulam was missing a necessary directory, but a cursory look did
not turn up anything obvious. I haven't been able to look further.

As for the "ue" editor in Gulam, I've had some problems with it too, though I
like it better overall than the "me" that came with MWC. But, I haven't been
able to get the iterative edit/compile cycle to work with "ue", so I'm
resigned to calling "me" from Gulam.

One further comment. Because I'm too cheap to buy a hard disk, I load MWC
completely into RAM (I have a Mega-2), using the ramdisks provided in
the 'rdy' utility which are supposed to survive warm-boot. I have found
that CSD operation is very iffy in this configuration; it often crashes
and sometimes takes the ramdisks with it (e.g. the ramdisks do not survive
the necessary warm-boot). Even when it doesn't crash, CSD sometimes has
problems finding things. CSD's reliability is inversely proportional to the
severity of the problem I am trying track down, part of the perversity of
software development, I guess, but CSD has proven to be worse than useless on
all the occcasions that I really needed it!

547. TURBODOS

Newsgroup: comp.sys.atari.st
Date: 1989-03-16 22:01:02 UTC
From: a360ad@blake.acs.washington.edu
Message-ID: <1236@blake.acs.washington.edu>
Source record: 249320

I have read that many folks are using TURBODOS.
Three times now, i have truncated
my gulam.g file when booting up with TURBODOS...
My auto folder looks like this:

c:\auto\supraclk.prg turbodos.prg startgem.prg

Though i am auto booting GULAM... i am booting GEM since
i need it for other things.

Should TURBODOS be the first program in the folder?
Any one have any ideas why my gulam.g file gets
corrupted (at the end) only when i boot with TURBODOS?

Any guess what other damage i am doing !

THanks.

>less equipped to combat an infection.

I think that compares more with police vs. burglars, or security systems vs. burglars. It only takes one programmer with virus code to mess up many users, and there are many more users than programmers.

Tell me how unreasonable this is. Someone publishes virus code. Some programmers take up the code, mutate it a bit, and distribute the mutant virus(es). Other programmers realize what has happened (after the fact), and produce code to protect against those strains. The virus-writers produce code to avoid the protection. And so on.

I'm told this is already happening. Now I ask, if virus code is published, and this is the result, then why spread more virus code? It leaves the users in the middle of efforts on both sides of the problem. The problem can only be solved after damage is done.

It's a sticky problem, no? Knowledge is protection, to a point. And if anyone wishes to have that knowledge, I'm not against them having it. I don't think it should be kept from those who want it, but I do think that there are

those that, if the code wasn't put into their hands without them having asked for it, might not have written viruses. To want to do something generally invokes more of a sense of responsibility. To do something "just because it's there" requires much less...

From: Xorg@cup.portal.com
Message-ID: <15910@cup.portal.com>
Source record: 249322

Just to clarify - the current TOS is limited to 16 meg *partitions*, not a 16meg drive! [grin] I don't know anyway around this other than the TOS fix in 1.4 (I assume its fixed there.) There are some vital programs, many come with ICD's host adapter and are excellent HD tools. With the 296N you're already going to be flying so no speed-up would be needed, they are iffy at best anyway. In my opinion the best DiskExpress-type program for the ST is Tune-Up by Michtron - its incredibly FAST and does an excellent job.

Peter Szymonik

551. Disappointing ST support from Atari

Newsgroup: comp.sys.atari.st
Date: 1989-03-17 00:20:55 UTC
From: karl@es56.UUCP
Message-ID: <8903170020.AA03032@es56.escd.uucp>
Source record: 249323

The ST is now four years old, and is maturing.

The support for the machine from Atari is still disappointing.
There is a new line of hardware (the Mega ST and the laser
printer) but there are no enhancements from Atari for existing
520ST and 1040ST owners.

The blitter upgrade died a slow death. After years of promissing
upgrades to 520 and 1040 owners, the subject is not mentioned
by Atari much any more. No one in their right minds believes that
the blitter upgrade will ever take place.

The nicely printed documentation for the ST has never materialized.
Years ago this documentation was supposedly close to release.

Networking? Yeah, there's MosesPromiseLan. Appletalk connections?
Are you kidding?

Now TOS 1.4 is coming out. Will this be available for 520 and
1040 owners? Look at history for the probable answer.

After four years of promises with a zero delivery rate, I have
become skeptical.

Copy me directly on any replies. Send flames directly to me.
I am waiting by my mailbox with a bucket of cold water. Also,
these are my own flames and not those of my company.

Is there anyone who is at CEBIT who has seen the new Atari handheld portable called the PC-Folio? This machine uses an 80C88, is 4"x8" in size and has a 40 character x 8 line display.

Can anyone tell me if it has a real full travel keyboard, or just a chiclet keyboard? Does it have an RS-232 port? Any builtin software? How about price? I'm interested to learn more about this machine...

Yup! The 1040 STfm is now the official name for the newer models. They even have new drive mechanisms in them now. I believe the new mechanisms are NEC brand and comes with a dust hatch built-in. We've had these computers in Vancouver, BC Canada for about the last two months now. Also the mother boards has changed quite a bit too with room for a blitter chip if you so choose.

Hello out there in NETland. I have a passing interest, well more than passing since my hard drive now has a bunch of junk on it (corrupted files, not lousy programs... ok, I have those too) in information concerning FATSPEED. This is a great program when it works-- and I am not saying that it does not-- I am just implying it (will that stick in court?). Anyway, at the time I started using FATSPEED (when TOS choked at having to shuffle slowly through >12Meg of files to find some free space to do some writing) I had not experienced any problems with my HD (ICD card, Adaptec 4070 & a Seagate ST251-1 [that is c65Meg @28msec... yeah I know... the 251 is MFM not RLL... it should not work... it has worked great for months now]. Then I start to see important things like my >40K machine code source files (that I have been working on for 6 months on and off...) corrupted and the assembler choking on them. Well, I get upset.

I first changed drivers from Supra's to ICD's (the one that does verifies). Soon thereafter the ICD gives me little <WRITE ERROR #0F23> messages on the bottom of the screen. Note the number: that is 3875 write errors on the same sector! Why only 3875 you say?... I reset the machine after c20 minutes of waiting! Anyway, I figure that a platter in the HD has a hole in it (who knows, maybe it has worms :~) so I do a low level format after I back up with Turtle (Does anybody know why Turtle is called turtle?). I formatted using ICD's software. It reported 5 bad sectors that I assume it marked as bad. Those 5 however did not correspond to the bad sector list stuck on the drive by Seagate (different heads etc.) what gives? Anyway, I overlook this inconsistency (the first time I formatted I entered Seagate's bad sectors like a good little boy). I then recopy all the data I had backed up back to the HD. Three days later (why is it that Turtle will back up the whole HD automatically but does not have the facility to restore the data automatically? (I know it is PD and I am not complaining or anything... Ok, so I am, sue me). In the process of restoring the data from the Turtle created floppy to the HD (from inside the Universal File Selector) I get that nice little virtual hello from ICD: "<WRITE ERROR #ALOT>". Again I reset, try again etc. I get mad, I scream, I throw computer peripherals at squirels (what did he say Mable?). In between denting squirels I inadvertantly copy the files I was having trouble with using the desktop (I had actually not forgotten to use it! I guess it really is intuative ;~) and it worked! no errors. So I sadly abandon UNIVERSAL and do the rest of the copying with the desktop. I manage to restore all the data without hearing a peep from ICD's driver. I am all happy and marveling at how a little bug in somebody's code could erase three days of my life when... yes! I get those fascinating little <WRITE ERROR etc. from the driver again. I get mad, kill a couple of squirels

and think... who can I b*tch at... "I know, call ICD and give then a piece of my mind" (I know... not too much). I do and they are surprised that such a thing would happen but could not suggest anything.

I should note that I don't think this is a hardware problem or some flaky chip in the interface cards or (more likely) Atari's DMA chip because the problem is not intermittent. It always happens on the same sector. One would think that if there is a bad sector the formatter would have marked it so and there would not be anything left for the driver to pick up. If there is noise, I could understand a bad verify but noise does not persist for 20 minutes nor does it appear for only certain special sectors. Also, shouldn't a driver that does a verify give up trying after a while and mark a sector bad instead of stopping the computer dead? I hope ICD heard this and puts in the patch (how much clout do BITNET complaints have?).

I then used Supra's HD utilities to MAP out bad sectors (using their driver because the ICD performs verification: the MAPper does not register a bad sector... it never gets there). The MAP function found several bad clusters and I assume marked them bad. I have since switched to Supra's driver again and am in the process of recopying the data back to the HD from floppy (I used a destructive MAP). The data, by the way, which was created from the HD by Turtle was not all intact. All of it was there but much of it was broken... assorted cherry bombs adorn my screen when I run them. They worked before Turtle wrote them to floppy. Am I just having a bad day/week or should I just sell my ST and get an IBM? I'm just kidding of course... I meant a Macintosh... But then again, maybe I should ignore silicon for a couple of decades (until the idiots who make computer equipment do it right) and get a pencil, some paper, a spreadsheet (I wonder if anyone makes the paper ones anymore) and a slide rule (Does anybody know how long their batteries last?).

Back to FATSPEED... I am suspicious of this program because, well, it is a convenient scapegoat and soon after I started using it I ran into (or merely noticed) problems.

If anybody is amused at my situation, shame on you, I'm dying here...

If anybody is interested in saying, "hey stupid, did you set bit 7 at location $4E2 before you installed the driver?... no? who let this guy touch a computer anyway...?" I'll be glad to eat humble pie. If you are right that is ;~}

Oh, and by the way, I have not, and never would harm a single hair on a squirel's head. Besides, I have not had the chance; here in Illinois they are still in hiding... maybe I should move to another state where there are more targets.. err... squirels.

thanks for enduring my (wow!) >100 lines of rambling... ...John

These points are well taken, but just to stimulate the debate, this is from
the official statement by Computer Professionals for Social Responsibility
(CPSR) on the Internet virus :

"An effective way to correct known security flaws is to publish descriptions
of the flaws so that they may be corrected. We therefore view the efforts to
conceal technical descriptions of the recent virus as shortsighted."

from the Winter 89 CPSR Newsletter

The statement goes on to give a bibliography of both technical and non-
technical articles about the Internet virus.

One thing to remember is that we Americans allow in our culture plays,
movies, TV shows, etc. that not only show how, but also glorify robbing
banks, murder, sex, etc. It's the old argument about incitement versus
freedom of speech. Certainly no one will accuse "Virus 101" of glorifying
the writing of viruses (as does John Brunner's 'Shockwave Rider' or William
Gibson's 'Neuromancer") - it reads more like a PBS documentary.

Should we censor it?

What does the net think?

Rich Fozzard

[danw@tekchips.LABS.TEK.COM (Daniel E. Wilson) writes...]

> K&R say nothing about clearing memory. Only static variables are
> cleared and this is done by the compiler.

Half right Dan. K&R, page 198, paragraph 3 (sort of):

"Static and external variables which are not initialized are guaranteed
to start off as 0; automatic and register variables which are not
initialized are guaranteed to start off as garbage."

Uninitialized data space is cleared (typicaly) by the operating system
for security reasons and to prevent having to have each and every program
do it (not the compiler)... On the few systems where the OS is known to
not clear the uninitialized data space, then a part of the startup module
in the program is used, but again, it's not "the compiler" that does the
clearing....

> Anyone programming in C that assumes that malloced memory is zero is
> making a very big mistake.

Agreed! Even in the example code shown in K&R, no attempt is made to
clear allocated memory. (That's what calloc() is for... :^)

ST Mouse Replacement;

I remember seeing several message a month or so ago abour replacement mice.
I was going through a British magazine and saw an ad for a compnay called
Datel who listed a replacement mouse which was fully ST compatible at 24.99
pounds. It says that it has a rubber coated ball and is of the optical type.
Looks slightly different in the photo. The address is
Datel Electronics
Fenton Industrial Estate, Govan Rd.,
Fenton, Stoke-On-Trent, England.
They have two phone numbers
Sales 0782 744707
Technical 0782 744324

Hope that helps someone. Oh yes. Datel also seems to have offices in Las
Vegas.
Datel Computers
3430 E. Tropicana Ave.
Unit 67
Las Vegas, NV,
89121

Sales 1-800-782-9110
Technical 702-454-7700

The American ads don't show the mouse replacement but it may be new in
England.

Good luck.

561. Error in Dumas' uud

Newsgroup: comp.sys.atari.st
Date: 1989-03-17 09:12:12 UTC
From: klute%trillian.irb@unido.uucp
Message-ID: <1207@laura.UUCP>
Source record: 249333

Dumas' uud failed to decode quikview.uue which was just posted
to comp.binaries.atari.st. With the -d flag on uud gave the
following output:

Begin uudecoding: quikview.arc
No sequence check (1).
Non uuencoded char <^>, line 40 in file: quikview.uue
Bad line =MDH,E^1H2V,1O8 2EH!(&$&A9 \ PL^B0B [P7.09N8/&#!P D3H)P>:($

Then I tried to decode the stuff with the regular Unix uudecode
and succeeded; a subsequent test of the generated arc also ran
ok. So I deduced that the bug must be in uud.

Does someone have the e-mail address of Jean-Pierre Dumas and
can report the error to him? Alternativly, does somebody have
insight into uud and the uue encoding scheme and write a patch
himself?

> C and D? If so, how?
>
The whole point of my article was that a partition is just numbers.
They are easily changed.

You will need a means to read, modify, and rewrite sector 0 of the hard disk.
This is easiest if you are using MINIX. Otherwise look into the Abacus
books #13, ST Disk Drives, Inside and Out. They have sample code to
read/write sector 0.

Then I would suggest you copy the 12 bytes for partition 2 (0,1,2) into
the slot for partition 3. Then change the size of partition 2 to N, a
smaller than it was. Then change the start of partition 3 to
(start of partition 2 + size of partition 2). Then change the size of
partition 3 to (whats there - size of partition 2.

```
part 2: GEM 1 ORIG_START_2 ORIG_SIZE_2
copy to part 3
part 3: GEM 1 ORIG_START_2 ORIG_SIZE_2
let N be new size for part 2:
part 2: GEM 1 ORIG_START_2 ORIG_SIZE_2 - N /* manually subtract */
part 3: GEM 1 ORIG_START_2 + N ORIG_SIZE_2 - N /* manually add/subtract */
```

The Supra disk software includes a sector editor, also.

I agree totally with this statement, despite my alarm at the publication of "Virus 101." My main, basic objection, really, is that comp.sys.mac is too widely distributed to carry this kind of information. Perhaps a better approach would have been to ask for correspondence (i.e., e-mail) with those who were involved in writing antiviral code, and then furnishing them with the articles. This would have blocked access by users who read comp.sys.mac via BBS's, read-only setups, etc. Yes, I remember how back in the "good old days," the net was populated mostly with AT&T techies, researchers and the like, but let me make it clear that that is not, repeat NOT the case now.

I understand how the information in the article would be useful for virus fighters, and priceless to a virus author. My analogy to a Reader's Digest article, where I compared the article to one on "How to Protect Your Home From Burglars," really isn't a good one. Burglaries are individual, isolated acts. Viruses are different. It only takes ONE person writing ONE piece of code to cause utter devastation on a global scale. Would anyone care to wager that somewhere out there, somebody's not playing with some code, with this article at his side? That's all it takes. Just one. I hope I'm wrong.

> Jim McCabe
> MCCABE @ MTUS5.BITNET

Jim,

DC-PORT offers 2 extra lines, for a total of three serial ports.
We have a prototype of the 5 port version (four additional ports) which
we just sent to MichTron so Tim Purves can adapt the BBS for 5 lines.
That prototype will then go to ATARI so they can get ATARI BASE up and running
with MichTron 3.0 and DC-PORT.

Anyway, the real question concerns DC-PORTs functionality.

1) Device drivers - we include a disk which has an AUTO folder program that
wedges itself in the TRAP vector to intercept Bconin, Cconin, Cauxstat, etc.
calls and redirect them to DC-PORT if the proper device handle is specified.
2) How easy is it to poll carrier? Very easy. That interrupt is monitored
just as DTR is. In fact MichTron BBS uses both of these. Sample code is
provided on the disk which comes with DC-PORT, so you (or anyone) will know
exactly how you can perform these functions.

We do not have plans to release the source to our driver, but are always glad to work with someone who wants to add support to their software, and may find the driver not acceptable.

Thanks for your interest!

Oooops...

What I stated in the previous article might be a tad misleading...

We do not monitor DTR or Carrier Detect, but provide a means for that
interrupt to be serviced on the ST. DC-PORT is 100% interrupt driven, not
polled like another piece of hardware available.

>from the Winter 89 CPSR Newsletter
>

Ah, "technical descriptions" is one thing, "source code" is another. Also, the Internet virus exploited security flaws that were within the power of system administrators to change. Macintosh viruses use published features of the OS that are not likely to change anytime soon (such as the resource manager). Publishing a description of "this is what Virus X does; you can detect is by looking for Y;the following procedure Z will remove it" is appropriate and laudable. Publishing "Here is the MPW source code of the new "Trash your Hard Disk" virus" is an invitation for misbehavior.

Some disk caching software is necessary in order to make the hard disk useful. I use Turbodos (and nothing else) for this task. The program pair DLII and REORG by Poole are very useful for disk maintenance. Unfortunately, I have not found REORG to be totally reliable - possibly I haven't used it correctly. DLII deals with crosslinked and missing sectors, shows fragmentation etc. REORG apparently puts sectors belonging to a file in logical order on the disk. But sometimes it seems to fail.

>You state that a non-programmer won't get anything out of your article, and
>that a programmer can easily find this information in "any good computer
>book." If that's the case, why post it in the first place? Gimme a break.

The information is useful to me, a professional programmer, so that I
can recognize the symptoms of known viruses, should my systems catch
any, and know what steps to take to remove them, and what damage
control/recovery options I have. Got that?

Yes, I could figure out (easily) how to write one of these babies from
systems manuals. I don't need or want to do that. I also don't want to
have to reverse-engineer existing viruses myself, if someone else has
that information. Especially not after a virus hits; by then I've got
enough trouble. No, I applaud Mr. Woodside's postings and encourage
him to continue.

>Also, keep in mind that comp.sys.mac is uploaded to many, many Mac BBS's
>around the country, including underground "outlaw" BBS's populated largely
>by high school and college hackers. I know of more than one local BBS of
>this type, where you can download virtually every Mac program on the market,
>and some people on there would LOVE to get their hands on this kind of
>information.

You know of BBS's that encourage theft, and you don't report them to
the FBI? That *is* idiocy! If you were really the upstanding citizen
you pretend to be, you would take steps to see these pirate boards
shut down. They are not doing the software industry any good, nor are
they any sort of modern "Robin Hoods", taking valuable software from
"rich" software companies (Ha!) and distributing it to poor users.
They are thieves.

>Your articles remind me of a Reader's Digest article I saw some time back
>on "How to Protect Your House From Burglars." It was the best article on
>"How to burglarize a house" I'd ever seen.

Oh? I suppose it told you what sorts of tools you'd need to break in,
and listed sources? More likely it simply described well-known weak
points in the house AND TOLD HOW TO CORRECT THEM. The same way Mr.
Woodside's postings do.

I'll bet you believe that distributing clean hypodermic needles to
heroin addicts encourages people to use drugs, too. Give *us* a break.

> Jeff Beadles, I've tried replying to your message in which you
>explained the mouse setup but my messages keep bouncing back. SIGH. We
>are needing to use SERIAL mice, right?

NO! The Atari ST uses a buss mouse. All Microsoft mice are buss-style
internally. They use an in-line adapter to convert it to a serial interface
if needed. Here's the differences when you but a Microsoft Buss mouse,
or a Microsoft Serial mouse:
(I'm talking about the Microsoft mouse that is white, with two buttons.
It's oval, and fits the hand rather nicely. On the bottom, it says:
"InPort (tm) Mouse".)

Microsoft BUSS SERIAL
The "Mouse" itself X X
(It is the EXACT SAME "MOUSE")

A "Buss" card for a PC X

A Buss -> serial converter X
(This is a small box, around 1x1x3 (inches))

Two serial cables. (One 25 pin, and one 9 pin) X

Some silly IBM-PC software & drivers X X
(Not needed for the ST.)

NOTE: They sometimes try to sell expensive programs with the mouse, like
CAD programs, PC-Pain brush, etc. Get the cheapest one you can (unless you
want the software :-)

I own an Atari ST, and my wife has a PC clone (Tandy 3000). She has a
"Serial" mouse. I bought a "buss" mouse for my ST. We've traded mice with
no ill effect. Either mouse will work on either computer, buss or serial.

The problem occurs infrequently but when it does occur it seems to cause damage to the data (FATs etc...). There are times when there is no problem with FATSPEED and others when there are. Just removing it and waiting a few weeks would prove that it is or is not concusively but who has the patience to wait and how do I know something else has not gone wrong? There is no physical damage but if the drive has to be reformatted it is just as catastrophic.

>Your problem is probably the RLL controller and the MFM drive, which
>is a no-no, especially with certain Seagate drives which are known to
>choke AFTER WORKING FOR A WHILE.
>

I recently had the same problem on my other system which has a new 30Meg Supra (with Seagate SCSI drive: STxxxN type). I promptly removed FATSPEED and am hoping it was the cause of the problem. I think it was.

I dont know about "certain Seagate drives" but I know that the ST251 and the ST277R are the same drive with different stickers on them. The ST277R has just tested good as an RLL device. I got an ST251-1 and ran it as RLL because that would give me a fast 65Meg, 28msec system. There is no ST277R-1 available (at least that I know of).

>
>Can anyone tell me if it has a real full travel keyboard, or just a
>chiclet keyboard? Does it have an RS-232 port? Any builtin software?
>How about price? I'm interested to learn more about this machine...

I wasn't at CEBIT, nor have I seen one of these machines, but I
did run across an article on what probably is the same machine in
the Sunday Times. To quote:

"... The Pocket pc weighs less than half a kilo, unfolds
as a screen and qwerty keyboard and has credit-card size memories
for removable files instead of floppy discs. It is compatible
with an IBM pc, comes complete with software enabling it to be
used for text editing, spreadsheets, or as a diary or address
book, and costs #200 [[pounds sterling which would be app.
$CDN415 or $US350, give or take -- esf]]. It runs for six weeks
on standard AA batteries, or can be used with a mains adaptor.
... The Pocket pc is being marketed by Californian giant Atari,
and manufactured in Japan and Taiwan. ... The sales target is
500,000 units in the first year."

Sounds interesting. Pity if it's true that the screen is only
8x40. I have a Model 100 and that's its most annoying feature...

Anyway, hope this answers some of the questions.

Tempus 2.0 has some limited programbility. You can rebind a key to a command
or sequence of commands by specifying the offset of the command in a jump
table (or something like that). This is so obscure that it could have been
invented by me, but at least you can actually do the rebinding interactively.
(The main problem with the current approach is that you can't specify a repeat
count for a command).

>Does the HP DeskJet ink-jet printer emulate an EPSON FX? Does this
>require an extra ROM cartridge?

It needs a ROM cartridge to do an epson emulation. I don't know
if it does FX, MX or whatever mode. The cartridge is around $100-125
(I think).

>Does the printer emulate the FX graphics mode?
>Does the printer emulate the 2-pass letter quality mode?
The standard graphics on the deskjet are compatible with many, but
not, all laserjet drivers. A lot of programs are now providing deskjet
drivers. The graphics resolution is 300 dpi and it is far better than
any mode on the Epson FX.

The standard text mode is letter quality courier 10 pitch, with the
option to switch to courier draft and increase the speed. If you are using
good quality bond paper (fairly hard finish) the letter quality mode
is extremely difficult to distinguish from laserjet courier type.

>Eric Terrell (att!druhi!terrell)

Apparently HP is bringing out a new deskjet, which is why the deskjet prices
have dropped recently. I have seen the original deskjet for about $625,
with a $100 HP discount if you send them an old dot matrix printer.
$525 is a great price, but I think I'd wait to see what the new deskjet
will have.

583. Re: New STF owner needs help

Newsgroup: comp.sys.atari.st
Date: 1989-04-11 14:09:32 UTC
From: MBERNAR@ERENJ.BITNET
Message-ID: <8904111619.AA15190@ucbvax.Berkeley.EDU>
Source record: 249205

Many thanks to all those who responded to posting. The symptom was that the ST had trouble reading the CONTROL.ACC during COLD boot. After warming up for about 15 min. it had no trouble booting up and reading CONTROL.acc. The majority of the responses, which I followed, was to return the ST and get a new one. I am now waiting. The suggestions for suspect parts include: the glue and mmu sockets, bad drive, bad disk. I don't think it was the disk, because I received a copy of the USA Language Disk which showed the same symptoms.

Like another new owner, I also fail to understand why ATARI does not include the ST-Basic manual with the computer. Only the reference guide is provided, which is useless unless you have the manual. Come on, Atari!

585. Extended argument passing conventions in Pexec() [MWC]

Newsgroup: comp.sys.atari.st
Date: 1989-04-11 14:41:31 UTC
From: dag@per2.UUCP
Message-ID: <841@per2.UUCP>
Source record: 249207

```
[[[
```

is the most efficient of the three.

The ARGS convention requires:
1) The copying of the environment by Pexec() which includes arguments,
2) A scan of the environment to find the arguments,
3) A size scan of the arguments to find out how much buffer is required,
4) then a rescan and copy into a local buffer translating FF into 00,
presumably building the argv vector at the same time.

The xArgs convention requires:
1) The copying of the environment by Pexec() which excludes arguments,
2) A scan of the environment to find the xArgs pointer,
3) A scan of the xArgs arguments to count up the size of the arguments,
4) then a rescan and copy into a local buffer.

The ARGV convention requires:
1) The copying of the environment by Pexec() which includes arguments,
2) A scan of the environment to find the arguments building the
envp[] and argv[] vectors in parallel.

The ARGS and xArgs proponents are proposing to load more code into the runtime startup to support their proposals. This extra code is to count up the size of some strings, allocate a buffer, and copy the strings into it. What does Pexec() do with the environment pointer? Well it counts up the size of the strings, allocates a buffer, and copies the strings into it. How many independent count-allocate-copies does it take to start a Gemdos process?

ARGV rides for free on top of Pexec(), ARGS and xArgs saddle the user process with additional work.

Programs which ignore the ARGV convention for arguments end up mis-interpreting ARGV specified arguments as environmental variables and passing screwed up environments on to their children.

This problem is addressed differently by the ARGS and xArgs proposals.

The ARGS convention will allow non-complying programs to pass their arguments onto their children, but the arguments will no longer be misinterpreted as environmental variables. The environment is still polluted with arguments, but the pollution isn't as cruddy as the MWC kind. :-)

The xArgs convention passes a pointer, encoded in ascii, to the parent's copy of the xArgs block. { :-) I've always felt that if consenting processes on the ST wanted to pass loaded guns among themselves that was their business, but that the default interprocess communication path shouldn't force processes to be so trusting. } So the environment is still polluted with argument information, but it is even less cruddy than the ARGS crud. :-)

In article <156@np1.hep.nl> Geert J v Oldenborgh suggested truncating the environment after extracting the ARGV from it. I think this is

an excellent suggestion: it adds one instruction, 2 words, to the runtime startup module and immediately cures one whole class of bugs, the class created by MWC compiled programs doing naive Pexec()'s.

I have two solutions for binary programs which screw up the environment by ignoring the ARGV standard but cannot be rebuilt with the improved runtime startup. Both involve the same transformation suggested above.

Solution 1 - call the program indirectly through a second program which truncates the environment before passing it on. This would involve renaming the offending program:

```
Frename(0,"numbnuts.prg","numbnuts.ugh");
```

and then compiling the following interface layer, which assumes that its own runtime startup is stepping on ARGV as discussed above, in its place:

```
#include <basepage.h>
#include <osbind.h>
main()
{
Pterm((int)Pexec(0,"numbnuts.ugh",BP->p_cmdlin,BP->p_env));
}
```

Solution 2 - rewrite the binary of the offending program to incorporate the environment truncation into the offending program's runtime startup. As long as the offending program does not address the process basepage with program-counter relative addressing, this is a simple matter of shifting the existing program text and data up by enough bytes to make room for the environment truncation code and rewriting the program relocation to reflect the new position. I have a program to do this.

How do you identify programs which need this treatment? Well, I assume that they usually reveal themselves when they attempt to call a command compiled with the MWC package. If the usage message generated by make, ld, cc, or some other MWC compiled utility seems inappropriate, then try calling a simple echo program like this:

```
main(argc, argv, envp) int argc; char *argv[], *envp[];
{
int i;
for (i = 0; i < argc; i += 1)
printf("%s%c", argv[i], (i+1==argc) ? '\n' : ' ');
for (i = 0; envp[i] != 0; i += 1)
printf("%s\n", envp[i]);
return(0);
}
```

This will tell you what arguments the suspect shell is actually
passing. If you can't get the suspect shell to call 'echo.prg'
you can trick it by temporarily renaming 'echo.prg' to the name
of the program which the suspect shell insists on miscalling.

If you're more energetic, you could write a protocol policeman
using the ARGV validation ideas suggested above.

In summary, the ARGV convention can be validated by comparing the
ARGV received in the environment to the ARGV received by the parent;
the ARGV convention rides for free on Pexec() while the new proposals
both involve additional overhead; and it is trivial to fix programs
which pollute the environment by ignoring the ARGV convention.

If Atari wants MWC to discard the ARGV argument convention, I hope
they'll wait until they can find something better to replace it with. :-)

588. Re: What an Atarian is like

Newsgroup: comp.sys.atari.st
Date: 1989-04-11 19:15:24 UTC
From: andyc@hplsla.HP.COM
Message-ID: <5440021@hplsla.HP.COM>
Source record: 249210

```
| So, all of you out there who are doubtless denying all of the above - let's
| hear from you. What do you USE your ST for? Those of you who are authors of
| USER oriented software - let's hear what you're doing, and tell us about
| your market. Those of you who are USERS, let's hear what you're using, and
| what for.
```

Okay, I'm a user:

1) I use LDW Power for personal finances and my small photo business.

2) I use First Word for "word-processing" (letter writing) and plan to upgrade to something better soon.

3) I use MWC for personal programming projects for fun.

4) I use ST Talk to 'tele-commute' into work occasionally.

5) I use GFA BASIC for quick'n'dirty generation of simple tools.

6) I use Easy-Draw for drawing up miscellaneous construction projects and a generating an occasional flyer.

7) I like to dink with Degas Elite, Flight Simulator and Time Bandit!

I anticipate purchasing a data-base program for business purposes and insurance inventory. And I might try CompuServe or Genie for the heck of it.

Let's see, this list looks like alot of the reasons people buy a PC or a Mac! But, the hardware was about 20% cheaper, and the software seems to be 25-75% cheaper for the major packages. And the Atari is much quieter than a PC (important to me), more fun to program than a PC or MAC, more fun to use with the GEM interface, and the games are better. So, it's a pretty good choice for home use. (I think perhaps I should have examined the Amiga closer, but more of my friends have Atari's).

>

I hacked together a Wren I (nominally 36 megabytes), one of the bargain Adaptec boards from Timeline and a Supra host adaptor. The ICD RATEHD program says I'm running a respectable 377kb/sec data transfer rate, but a shameful 527ms average seek rate. This is an old drive, but that seems more than a bit much. I have the drive mounted vertically -- is there a possibility that could affect the stepper's positioning of the heads? I'm running a 1:1 interleave -- could that be involved?

> Is there caching? Yes, there are lots of PD and commercial

>

Because of the horribly slow seeks I'm getting, PATH searches can be painful. For that reason, I've installed Atze Dijkstra's DCACHE program with the argument cde=c18, creating a common cache for drives C, D and E of 18K. That's enough to keep all the directories in RAM as well as some smaller utilities, such as the file pager I use for UUCP stuff. It helps a lot and it's worth the RAM even on my small system (512K).

DCACHE was published in this newsgroup about nine months ago.

Well, yes but.... My only gripe about this is what do I do if Turtle broke
a large folder up over several disks? Enlighten me if I'm wrong (because it
is entirely possible), but when I try to copy a folder to a place where a
folder with that name already exists, it wants to overwrite the entire folder.
I had lots of folders like this when I did my manual restore. I had to open
the folder and copy out each file individually.

But then again, I can't really think of a solution to this (at least from
the desktop). I think I'm really spoiled because I've used DiskFit on the
mac which is truly fantastic. I just assumed that such an application would
exist on other machines.... I guess not.

594. Fun with Sun - the Mouse

Newsgroup: comp.sys.atari.st
Date: 1989-04-11 23:33:12 UTC
From: clf3678@ultb.UUCP
Message-ID: <658@ultb.UUCP>
Source record: 249216

If you have a Sun workstation:

1) I pity you. Although it is VERY powerful, it is crippled by that damn awful mouse. We have Sun 3/50 workstations at school, and those damn mice get the biggest complaints.

2) If you want to be silly, put the mouse on the screen. The cursor will FLY up to the top of the screen. As far as I can figure, since the mouse is optical, it mistakes the scan lines as one of those black lines on the pad.

Now as for the Atari mouse, I've seen better and worse. Luckily, I have the Japanese mouse, so I have had no major problems with it after 2 years (except for replacing the left button). Has anybody experimented with putting a different switch in it to get more feedback?

=cf=

595. startup screen

Newsgroup: comp.sys.atari.st
Date: 1989-04-12 03:40:29 UTC
From: jriegel@polyslo.CalPoly.EDU
Message-ID: <10201@polyslo.CalPoly.EDU>
Source record: 249217

I have been experimenting with writing a "startup screen" type program such as exists on the Amiga and Mac, to replace the desktop's background. But I have noticed that the desktop's windows tend to eliminate any background, and the desktop seems to simply redraw the green (or dithered on monochrome) field. Does anyone know any way around this? I had thought that the desktop would simply have the green background set up in a buffer. This would speed up redraws. But apparently the desktop itself must redraw the screen and any windows that are underneath another window.
Does anyone know of any existing utility that installs a background screen, or any way to get around the above difficulty?

-Jeff Riegel

>To: INFO-ATARI16@SCORE.STANFORD.EDU
>Easy,
> Use A-line instruction 10 $a i.e. opcode $a00a
>e.g. put exactly this instruction in your code (if you've not heard of line
>A instructions this may seem a bit wierd, but I
>assure you it works)
> dc.w $a0
>Mark Powell

sorry for the slightly butchered retelling of the message but...
I am familiar with the line-A calls and the VDI ((or is it AES)... the GEM
type) calls for mouse cursor handling. None clear up the problem.
I assumed that calling the hide mouse line-A opcode several zillion times
and then using either the line-A show mouse code with a cleared "mouse hidden"
counter or the VDI (?) code to show the mouse cursor no matter how many times
it was hidden (which works otherwise) would fix the problem but it did not.

My god... is that some kind of badly mutilated English up there or what?

anyway, I am still up that mouse hiding creek and have no system software
paddle to save me.

The desktop does not have the problems my shell has. What does it do? I have
tried all the leagal ways of fixing the problem that I can think of. Does the
desktop do something illegal? But then that would actually be legal
just undocumented. (Atari-speak)

any helpful ideas still welcomed...

...John

> work.

Over a year ago I wrote a program which substantially does this task, and I uploaded it to one of the archives (sorry, I forget which). What it does is to print a Degas file (monochrome only) on an Epson-compatible 9-pin printer, using all NINE pins. Because the pin spacing is 1/72 inch, the printing is done sideways, which is the only way it fits an 8.5x11 sheet. The result is much better than Atari's partial printout of a distorted screen (ie, X and Y scales are different using plain alt-help, and the right hand side of the screen is missed completely).

I haven't used the program for a while, though, because I got a 24-pin printer and rewrote the program for it. That baby will print a screen horizontally either in 1x scale (1 dot = 1 pixel) or 2x (2 dots = 1 pixel). The 1x printout is only 3.5 inches wide. This program still needs a little work before going public.

On the issue about limits on the persons time.. If it doesnt give you time limits on the files then someone could spend forever downloading and tie the system up for quite a while. If a person is given enough time they should be able to get through all the messages and still have time left unless your talkling about large message bases.. In that case multilined systems are the only way...

And about the linear user limits.. I used the invitation onlly rooms for a while except that it did not allow me to easily add someone to a bunch of message bases.
I switched to FoReM cause it had all the power I needed although I miss some of the features of citadel...
With Forem I have ALOT more flexibility than I ever Had with Citadel..
However steve, since I have sent out some disks to you I hope you can send me the latest and greatest version of citadel and I will see what happens with it.
I am not sure if I asked for the source code but if you can get that I would like the source too.. I want to make it run from within forem...

600. Comdex impressions

Newsgroup: comp.sys.atari.st
Date: 1989-04-12 05:55:09 UTC
From: saj@chinet.chi.il.us
Message-ID: <8202@chinet.chi.il.us>
Source record: 249222

I just got back from Comdex. It's hard to separate what I actually heard/saw from what I wished (except that Moniterm Viking monitors are definitely real and beautiful). My impression was that TOS 1.4 is considered ready, and *some* ROM-s are being delivered to Atari. My impression was that everyone who should have known for sure considered the 16 MB limit on disk partition size a dead issue (but the explanations varied). My impression was that the new guy in charge of Atari software (is Antonio Salerno the right name?) means to put things in better shape, starting NOW and continuing for as long as it takes----and is tough enough to have a chance of doing it. The PC4, STACY and the Portfolio were spoken of as if the engineering on them was done, and production was imminent. The TT was not on display, but the talk about it was along the lines of "it'll be wonderful, and not so far in the future either, but we're displaying the things we'll be selling first". All in all, a very promising show. If the 2 lightweights and the PC4 actually get introduced before the next Comdex, and Megas are shipping with TOS 1.4, maybe we'll be able to say Atari promised a lot and delivered on it.
Steve J.

For Sale:

1) Digidesign's Sound Designer Universal(Version 1.3) software for
the Atari ST with backup disk. This is Waveform editing/Digital
Signal Processing Software which supports the following samplers:

Akai S700/X7000/S900
Casio FZ-1
Roland S-10/S220/MKS-100/S-50
Ensoniq EPS/Mirage/Multisampler
Korg DSS-1/DSM-1
Yamaha TX16W
E-mu Systems Emax
MIDI Sample Dump Standard

Asking $220 or best offer.

2) Dr.T's Keyboard Controlled Sequencer (KCS) Version 1.5 for the
Atari ST. Asking $120 or best offer.

3) Yamaha FB-01 FM Module. Asking $180 or best offer.

Please direct inquiries to:

>launched this month. I don't know what has been cut out of this version
>of Augur.
Is the scanner used here the same unit used in various PC hand scanners such as Scan Man? Folks who have used Scan Man seem pretty happy with it on the PC and it would be nice to find something comparable on the ST.
I wonder if this product will ever make it to the US.
I've seen an ad for something called "Geniscan GS4000 ST" from Datel Computers that offers "scanner, interface & scan edit software, 105mm scanning width & 400 dpi resolution" for $324.99 but I haven't seen any reviews or even a more detailed description than what I just quoted.
I don't know what the Colibri costs without the OCR software, but $325 seems a bit pricey considering Scan Man and its kin are in the $200 neighborhood (discount houses).
If anybody knows more about these products in the US market, please let us know. The low-cost printer-clip-on scanners don't give quite the quality I'd like, and machines like the HP Scanjet or Navaronne scanner are too expensive for semi-casual use. A mid-range good-quality scanner like those in the PC world would be just right.
Thanks,
Don Rice

604. Virus plural form revisited

Newsgroup: comp.sys.atari.st
Date: 1989-04-12 10:52:00 UTC
From: AWINFHAH@HMARL5.BITNET
Message-ID: <8904120954.AA08789@ucbvax.Berkeley.EDU>
Source record: 249226

About two weeks ago I wrote:

|A shallow survey of latin reveals the following information:
|
|Singular vir vis virus
|Plural viri vires virus
|Meaning man power,force poison,venom
|
|Therefore the correct plural of virus is.... virus. In order to avoid
|confusion I suggest that 'viruses' be used (the English plural of virus).

A quick email response from rlee@ads.com (Richard Lee) convinced me that this is not the complete truth. I consulted my former Latin teacher and we reached the following verdict:

1. Virus belongs to the 4th declension and its gens is neutrum, even though it ends in -us.
2. Virus only exists in the nominativus and accusativus singularis, and has no genitivus (though late Latin writers started to use a genitivus ending in -us), nor a plural.
3. If virus were to have a plural it would definitely be virus, but again it hasn't.

From this information I draw the following conclusions:

1. I was wrong about the Latin plural of virus.
2. My suggestion to use viruses still holds.
3. The fact that there is no Latin plural of virus explains why all modern languages have their own (usually regular) plural of the word.

I'm planning on getting a 65 M/byte drive from 3rd Coast Technologies,
has anyone bought a drive from them ? Any comments, good or bad, appreciated.
Does anyone know the specs of the 65M/byte drive ? Is it a 28 ns drive ?
I heard that the 40 M/byte model consists of a Berkely Microsystems BMS-100
DMA -> SCSI board,an Adaptec 4070 SCSI controller board and a Seagate 251 drive.
The main advantages I see with the drive are that a second mech can be added
easily, it comes preformatted and most of all the price is low at #549. The
main disadvantage I anticipate is with connecting other DMA devices later as
there is no DMA through. Is this much of a problem ? Do most other DMA devices
provide their own DMA through port ?

Thanks in advance for any information,
Padraig.

(By the way the price given is in pounds sterling - the pound sign # is always
getting converted into $ (dollar) signs on it's way through BITNET.)

606. Pseudo media change indication

Newsgroup: comp.sys.atari.st
Date: 1989-04-12 13:23:13 UTC
From: rp362@estevax_a.UUCP
Message-ID: <139@estevax_a.UUCP>
Source record: 249228

I am using a disk cache program, that I found in comp.sources.atari.st, for caching floppy disk sectors.
I detected a problem when switching directories within a window at the desktop. Each time the directory is changed, a media change indication occurs and the cache is reset (the reset is desired as normal action after a real media change). However, there was no actual media change, nevertheless the BIOS.mediach propagates a real media change (not only a warning: media may have been changed), and a BIOS.rwabs returns -14 (media changed). For the cache program there is no possibility to distinguish between this pseudo media change indication and a real media change.

Such pseudo media change indications do not occur when directories are changed within a command shell or within a program.

What extra operations is the desktop doing above the normal GEMDOS operations for directory changes ?
What is the reason for this behaviour of the desktop?
How can I recognize a real media change ?

Thanks for any help!

>Okay,
> We've sort of got the name sussed. Why the mount Fuji logo?

Pick your favorite theory:

1) It is a stylized picture of Mount Fuji, used because Go (see "Origin of 'Atari'" discussions) is a Japanese game, and Mount Fuji is one of the most Japanesee B-) images known.

2) It is a stylized "A" for "Atari".

3) It is a rune for Atari's first video game, "Pong". The two curving bars on the sides indicate the players, and the center bar indicates either the video game itself, the "ball", or the dashed line that divides the Pong playfield.

By the way, the man who developed the Atari logo (sorry, forgot his name) was an arcade cabinet art designer for Atari Games. His favorite bit of work was the (Atari color vector graphics game) _Space Duel_ cabinet, and his last job before he died was the _Gauntlet_ cabinet art.

Easel/ST is a small, slightly-hard-to-find program that will do just that.
You give it DEGAS pictures for whatever resolution you'd like to boot up in,
and Easel will load it as your Desktop image.

I personally don't see the use for such a thing, but if you can get it cheap
enough, why not?

611. Re: Getting WP to reconsider the Atari market.

Newsgroup: comp.sys.atari.st
Date: 1989-04-12 15:39:36 UTC
From: saj@chinet.chi.il.us
Message-ID: <8207@chinet.chi.il.us>
Source record: 249233

The article this is a follow-up to asks people to request that WordPerfect continue Atari support. I think that's what they want to do already. There is a WordPerfect display in the Atari booth at the present Comdex. The WP representative seems enthusiastic. If there are ever enough TOS machines out there to make it an attractive market, I suspect WP will be back fast. In particular, I think they realize that slow sales are due to the small user base and intense competition, rather than theft of software.
An aside: when I looked, WP seemed to have some problems running in the configuration displayed (latest TOS 1.4, which people seemed to believe was the production version; MEGA 4). If it's running smoothly on Thursday, that should be evidence of continuing support.

614. Problem with the ICD host adapter amd a Maxtor LXT100S

Newsgroup: comp.sys.atari.st
Date: 1989-04-12 17:29:58 UTC
From: VBRANDT@DBNUAMA1.BITNET
Message-ID: <8904121729.AA01288@ucbvax.Berkeley.EDU>
Source record: 249236

Hello all,

... I have a problem with the ICD Host Adapter and a Maxtor LXT100S. The old LXT100S had 92 MB formatted storage. Since Maxtor changed the SCSI firmware, the new ones have 96 MB. I can only guess that they increased the number of sectors per track from 31 to 32 (the manual says 31 + 1 spare).

Both the adapter and the drive are very good hardware, and I am convinced that they make up a good HD for the ST. BUT: How do I tell the ICD formatter about the new increased capacity? I have a fairly new (January '89) version of the software, but the drive is still newer.

I have done the obvious: I changed the spt entry in the ICDFMT.DAT file from 31 to 32 tracks. This seemed to work, until the formatter came near the end of the drive. There it reported about 1500 bad sectors. This sounds a bit high, especially since Maxtor specs their drives at 1 hard error per formatted MB. So I wouldn't be surprised at 100 bad ones, but 1500 ?? The formatter printed out only about a hundred, though. (!) I haven't played with the other options yet, such as changing the number of reserved tracks (it's 9 now, for whatever reason -- the LXT100S has a dedicated parking zone).

I have defined 6 partitions. The HDUTIL program option 'check for bad sectors' consistently crashes on all of them. The CLDEMO program (a demo of an ICD hard disk cleanup program) crashes on the last partition, and displays weird values for the partitions over 16 MB (yes, I have TOS 1.4). Does anyone use the 'real' version of CLEANUP? Does it work??

The German distributor, Weide in Hilden, W. Germany, couldn't help. They suggested to use interleave 2:1. Bah!

So my question is: Has anyone used this combination before ? Does anyone have a newer version of the ICD software that takes into account the changed LXT100s firmware ?? HELP !!! Pleeeease ????

Of course, I've mailed off a letter to ICD. But we all know snailmail, and to the US at that! During the CeBIT fair at Hannover, Tom Harker, president of ICD, told me that they were going to get a usenet feed (I think he said that they bought a VAX or something). But I can't call their BBS, and I don't have GEnie or CompuServe accounts. (I *can* supply their Illinois phone #, if someone near them could give them a call, that would be ***grreat*** !!!)

Any and all help, hint, good advice, remark etc. is most welcome. Thanks!

615. TeX

Newsgroup: comp.sys.atari.st
Date: 1989-04-12 17:32:29 UTC
From: mcli@uhura.cc.rochester.edu
Message-ID: <1491@ur-cc.UUCP>
Source record: 249237

Hello everyone,

I'm interested in obtaining a version of TeX for the Atari 1040ST. However,
I see that there are a few versions of TeX out there like CTEX and STTEX.

What I would like to know is:

1. Which is your favorite?

2. Why is it your favorite?

3. Does it run on a Monochrome 1040ST with only 1 DSDD drive?

4. Can you get decent printouts on a dot matrix Epson compatible printer?

5. What dvi previewer do you use?

6. Do you have to generate your own fonts?

7. Which server has the latest versions.

Thanks a lot. Reply either by Email or posting. I'm sure there are others
who are interested.

Maurice

616. Supra 2400 modem

Newsgroup: comp.sys.atari.st
Date: 1989-04-12 17:50:30 UTC
From: dav@eleazar.dartmouth.edu
Message-ID: <13025@dartvax.Dartmouth.EDU>
Source record: 249238

I have this Avatex 1200 at home that seems suceptable to line noise problems. In my latest issue of STart I saw an add for the Supra 2400 and Flash 1.6 for $155. How good is the Supra? Is it fully Hayes compatable? Does it have a speaker?

In the same ad I saw a simular deal for $175 w/ the Avatex 2400. Is it a better quality modem than the 1200? I posted an article about the problems with my Avatex 1200 and got lots of responses that the modem was ah... shall we say... 'not too good'.

>Does anyone know any way around this? I had thought that the desktop would
>simply have the green background set up in a buffer. This would speed up
>redraws. But apparently the desktop itself must redraw the screen and any
>windows that are underneath another window.

I think the way they are doing it is actually the faster. Copying the
background from a buffer would probably result in something like
move.l (a0)+,(a1)+
at the center of a loop, whereas just putting the pattern back could be
move.l PATTERN,(a1)+
where PATTERN is some constant. I expect that is a fair bit faster.

But anyway... I was also thinking about this sort of program a while back, and
here are the approaches I was considering:

1) Have a desk accessory open a window with the image. Am I right in thinking
that the accessory will then correctly get the window redraw messages? If so,
this would be very straightforward.

2) If I remeber correctly, the background is window 0. Therefore, you might
be able to intercept TRAP 2 looking for redraw window 0 messages, and handle
them yourself. I'm not sure, however, that these messages are ever sent, it's
possible that redrawing the background is done automatically as part of
something else (and, of course, intercepting traps is no doubt a developers'
no-no).

> Does anyone know of any existing utility that installs a background screen,

No, which is kind of surprising. I can't believe no one has thought of this
before, which may mean that getting it to work is a lot harder than either of
us imagine.

I bought the Atari version of Falcon as soon as it came out. Right out of the box disk 2 was bad. My dealer was kind enough to replace it with his personal copy of disk 2. I played it for a while and then put it away to do "serious" work with my machine. When I took it out again recently disk 2 was garbage. I wrote to Spectrum Holobyte explained what happened and ordered the backup disks. The disks came with an invoice (I had to pay for the new disks) that had the reason for replacement marked "User error." I don't know about you but to me storing the disks in their original box (away from magnets, etc.) for a couple of months is not user error!

I then figured out that the only way to get the disks to work was if I physically removed the hard disk cable before turning on my machine. Now both sets of disks work. I assume that if you have an internal hard disk you're stuck.

You are supposed to be able to copy disk 2. I have yet to get a copy of disk 2 to work. Spectrum Holobyte's answer was to send them my disk so they could copy it.

Other than the copy protection and the stupid code wheel (which does not look like the on screen graphics) Falcon is a fantastic simulator.

I read in a magazine that Spectrum Holobyte is upset that there are already code wheel diagrams and other "cheat sheets" for the Atari version on some BBSs. What do they expect? The manual is the same as the FalconAT manual (the table of contents even says FalconAT) and I assume it uses the same type of code wheel. I know all the keys are the same. Don't they realize that someone with a copy of the cheat sheets for the IBM version retitled it and posted it for the Atari? I also read that Spectrum Holobyte is going to release Orbiter for the Atari. Orbiter was a really acurate space shuttle simulator that was way too slow on a PC. It should be better on the Atari, but I won't buy it if it uses the same protection as Falcon.

By the way, I had similar problems with Gunship but after ordering the backups disks they were nice enough to reply to my letter. I guess I always like MicroProse anyway.

ttfn,
Brian

619. Memory upgrade shortens life expectancy???

Newsgroup: comp.sys.atari.st
Date: 1989-04-12 19:27:50 UTC
From: tim@brspyr1.BRS.Com
Message-ID: <5751@brspyr1.BRS.Com>
Source record: 249241

I just had a strange conversation with my local Atari service center.

I have been experiencing some problems with my ST lately (a 520 ST with
2 meg upgrade using the Aerco board), and it finally went completely yesterday.
So, I called the local service center and explained that I had a problem with
my ST; the person I talked to asked if I had a memory board upgrade and when
I said yes, she said she didn't want to see it.

THEN she said that she had seen "a lot" of ST's with fried main logic boards
and some power supplies after about 18 months of using an upgrade board, and
that the only corrective action is total replacement of the CPU. She said to
save the $30 that it would cost to have them open the case and find this out.

Is this that common? Can something be done to prevent it? Is there some "safe"
upgrade that we should all be using, or are all memory upgrades terminal? Is
my local service center pulling my leg?

(I had heard that the connection of the memory board becomes loose, and I tried
to get a better connection, but with no success).

Any information you can add would be greatly appreciated.

>Does it have a speaker?
>
Simply put, good, pretty much yes, and yes, respectively. I run one off
my Atari 130XE & have had little problem. All of the Hayes set is supported
except for some stuff that would rarely be used (except, perhaps, in the UK.)
The speaker tends to be a bit loud, but it is there. I owned an Avatex before
it (1200, not HC), and the Supra is a good bit better. For some reason, though,
the DTR line isn't used properly in mine. Anyone else have that problem?

621. ARGV definition (MWC)

Newsgroup: comp.sys.atari.st
Date: 1989-04-12 19:49:46 UTC
From: dag@per2.UUCP
Message-ID: <845@per2.UUCP>
Source record: 249243

This is posted for a friend who works at Mark Williams Company and does not have direct access to news. Please E-mail replies to rec@mwc.uucp.

Subject: ARGV definition

For those who don't have MWC documentation, or do but don't RTFM, here is the definition of the MWC argument passing convention. I'm quoting from the 1986 manual, but the text, and the convention, hasn't changed in substance. This is the from the article for 'crts0.o' which I found by following the cross-references from 'argv'.

"The runtime startup module, crts0.o, is the first code executed when
"your program is run. As its first action, it parses the environment
"string list passed by TOS into a vector of string pointers. This
"vector is saved in the variable external char **environ, for the use
"of the library routine getenv(), and passed as the parameter char **
"envp[], for the information of the function main().
"
"If the environment vector contains a parameter named ARGV, then the
"run time start-up assumes that the program was executed by msh (or
"by some other program that agrees that programs should have arguments),
"and that the remainder of the environment vector is an argument vector
"that should be passed as the parameter char *argv[] to the function
"main().
"
"If the argument ARGV has a value, such as ARGV=CCAP??, then the
"value should consist of characters from the set [CAPF?]. The char-
"acters describe the origin of the system file handles as Console,
"Auxiliary port, Printer port, File, or unknown. The runtime startup
"stores the value of ARGV, if it exists, into the external variable
"char *_iovector for the use of the routines that emulate the
"functions of the COHERENT operating system.
"
"If no ARGV parameter is found in the environment, then the run time
"start-up program assumes that the program was executed by a simple
"GEMDOS Pexec(). The buffer cmdtail is parsed to form the argument
"vector for main(). ARGV[0] is supplied by the external variable
"char _cmdname[], which should be supplied by your program, or it
"will be set to ? by the library. The value of the variable _iovector
"will be set to the default CCAP??????????????????????????;.

The only change which I can detect in the latest revision of the manual is that the crack about '(or by some other program which agrees that programs should have arguments)' has been toned down.

I've always been a little caustic on this subject, :-).

The only change in the implementation not yet noted in the article
is that the default value of argv[0] is now the empty string in
accordance with the draft proposed ANS c language.

Quoted material is Copyright (c) 1986 by Mark Williams Company.

622. Re: DESKJET INK CARTRIDGES

Newsgroup: comp.sys.atari.st
Date: 1989-04-12 19:50:12 UTC
From: neff@hpvcfs1.HP.COM
Message-ID: <2150001@hpvcfs1.HP.COM>
Source record: 249244

When refilling DeskJet ink cartridges be aware of the fact that the cartridge was designed to be disposable and our thermal resistors and orafices are not designed to last "forever". This coupled with various contaminants which will inevitably get into the "roll your own" refill techniques implies that print quality (mainly weak/clogged/dead nozzles) with degrade over time. You might be able to refill a cartridge a few times, but don't expect to do it forever.

One easy way to save money is to print all rough drafts in draft mode. This is both faster and uses less ink. If you print approximately one rough draft for each letter quality draft the cost per page for ink will be less than the cost per page for toner in a LaserJet. Of course if you also refill LaserJet cartridges this saves money, but refilled LaserJet toner cartridges are grounds for voiding your warrantee (for some good reasons). With refilled DeskJet cartridges the worst that can happen is damaging a disposable cartridge or getting ink all over the place :-).

As for waterfast ink, if there was a cheap "over the counter" ink that you could squirt into a DeskJet cartridge and get good print quality on plain paper with waterfast results, don't you think HP would be using it :-)?

As for our own progress on waterfast inks I am not allowed to give any time frames, but I am allowed to say we have a high priority highly staffed project working on the problem and we are confident that we will have waterfast DeskJet ink cartridges at some point in the future.

One more note for you Atari users who think the DeskJet is too slow. We just announced the DeskJet Plus. It will do graphics 5X faster than the DeskJet when the parallel port is used. It also does text faster and picks and moves paper twice as fast. It is priced at $995 and the DeskJet is now priced at $795. I did most all of the performance improvements on the DeskJet Plus and would be happy to provide more details upon request. I suspect that your Atari applications cannot generate graphics as fast as the DeskJet Plus can print it.

Presently there is no official way to upgrade a DeskJet to a DeskJet Plus, however it mainly involves a new logic board (faster CPU with more address lines, more ROM and RAM) and a new paper motor, plus a few cheap odds and ends. It is not that hard to insert logic boards and replace the motor (it was "self evident" to me, and I am a CS type). I have presently asked for permission to post the part numbers, cost, and instructions to do an upgrade but I have not gotten permission yet and I probably will not get permission, but who knows. If DeskJet owners scream loudly enough an upgrade may be available, but it would be fairly

expensive (probably in the $300 to $400 range). If you do the labor yourself the actual parts might cost somewhere in the low $200 range. There is only one aspect of the upgrade which is "subtle" and could be hard to describe and hard to do yourself.

623. Re: how to kill a mouse cursor

Newsgroup: comp.sys.atari.st
Date: 1989-04-12 20:25:26 UTC
From: kloppen@gmdzi.UUCP
Message-ID: <1022@gmdzi.UUCP>
Source record: 249245

I read your question a while ago, and I read the answers, I think they are not very helpful. So I'll try to explain what I know.

I mostly program in Modula2 and never used a line-A instruction. The AES has a graf_mouse call (AES 78). I remember, but dont know exactly, that after several show mouse (#257) calls, you have to call hide mouse (#256) as often until the mouse is killed. But when you call it whith show mouse, the mouse appeares independent of hide mouse calls.

The VDI has show cursor (VDI 122) and hide cursor (VDI 123). The VDI has the opposite counting: "Once the cursor is visible, a single Hide Cursor causes the cursor to disappear. GEM VDI keeps track of the number of times the Hide Cursor is called..."

What happens if these calls are mixed, what can be the case in calling foreign programs, I dont know. But in a similar case I call the VDI Hide Cursor and the mouse is always invisible.

The second problem arises - I think - when programs dont close their windows and your shell inherits them. The desktop always cleares the entire window system after program termination. I'd try do make close window calls for 1, 2, ... 8? after return of a called progam.

624. question about uniterm 2.0e

Newsgroup: comp.sys.atari.st
Date: 1989-04-12 23:03:00 UTC
From: drc@beach.cis.ufl.edu
Message-ID: <20063@uflorida.cis.ufl.EDU>
Source record: 249246

I just picked up Uniterm 2.0e to replace version 2.0c.
One question: how do I abort dialup? I have had to warm-start
my machine to abort a dialup; nothing else I tried worked.
In version 2.0c, an alt-c would do the trick; it didn't work
for 2.0e. Did I screw up something in the setup? Please mail
any replies directly to me. Thanks.

drc

625. Single sided -> double sided

Newsgroup: comp.sys.atari.st
Date: 1989-04-13 00:19:02 UTC
From: BSR@19634.UUCP
Message-ID: <8904121505.AA12156@cernvax.uucp>
Source record: 249247

Hi y'all,
Could some floppy disc guru tell me if the following is a good thing to do or not? I bought a 520 ST with single sided floppy a couple of years back. I used double sided discs and formatted them single sided, as one would. Now I have just bought a double sided drive, and I would like to use the other sides of all those discs I have collected. What I have tried to do is this: format the tracks on side 2 using Flopfmt, then shift all the existing tracks on side 1 so that consecutive tracks are now opposite each other on the disc. This diagram shows the conversion process from SS to DS...

```
0123456789 flopfmt 0123456789 shift 02468ACEGI
SS ---------- -> ---------- -> ---------- DS
unformatted formatted 13579BDFHJ
```

I then redo the boot sector to specify the double sidedness.
The new tracks A to J are now clear and usable. The disk now has twice the space as before.
My query is, is this a sensible thing to do? I have written a program that does this, and it seems to work okay. Would anyone like to comment on it? Please email me, and I'll summarize the response. Thanks

Barry Rowlingson

627. Atari equipment/books/sw for sale

Newsgroup: comp.sys.atari.st
Date: 1989-04-13 04:00:00 UTC
From: timk@egvideo.UUCP
Message-ID: <1986@egvideo.UUCP>
Source record: 249249
Cross-posted to: kw.forsale,comp.sys.atari.st,misc.forsale

I thought I had these sold, but due to various reasons the sale fell
through so I'm trying again.

I have an Atari 520 ST w/512K memory, external 3.5" 720K Floppy disk drive,
and monochrome monitor that I haven't used for almost a year now. Works
great, I've had no complaint about it's operation, but can't justify
having a multi-$100 system sitting around gathering dust. I'm asking
$550 for it.

I also have a copy of each of the following books:
Atari ST Internals
Atari Disk Drives inside and out
Atari GEM Programmer's reference.

Asking $15.00 each. (They retail for at least $25.00 each on the store)

1 Copy of Assembpro - a graphical system for assembly language programming
for the 68000 on the ST. Looks real nice, a friend of mine that's an ST
buff says he uses it for all his machine programming and has never had
a problem with it. Comes with manual and single 3.5" diskette.

Asking $50.00

Prices are all in CDN funds. If you pay in US funds I'll pay the shipping
costs to your location, otherwise shipping is extra. From what I've been
told there's no problem with duty costs going over the boarder (computer
equipment, software, and books are exempt from duty) so if you're in the
states that wouldn't be a concern.

628. Re: PD modula 2 for the ST

Newsgroup: comp.sys.atari.st
Date: 1989-04-13 07:49:46 UTC
From: klute%trillian.irb@unido.uucp
Message-ID: <1279@laura.UUCP>
Source record: 249250

Here is some good news for you who send me e-mail to get the
Modula-2 system for the ST and for you who didn't: It's really
free and I am allowed to pass it on. I will do so as soon as
the ZOO archiving utility is out on comp.binaries.atari.st.

Please understand the the producer is neither willing to give
any support nor to answer questions of thousands of user all
over the world. If you have the system be happy. Don't expect
anything from anybody.

629. Re: UUE

Newsgroup: comp.sys.atari.st
Date: 1989-04-13 10:38:05 UTC
From: S82895@prime-a.plymouth.ac.UK
Message-ID: <8904131107.AA23560@ucbvax.Berkeley.EDU>
Source record: 249051

Hello Chris Edington.

UUE is a UNIX program (so I have been told, but more on that later) which will convert an 8-bit binary file (in fact it can be used on any file:7-bit or 8-bit) to a 7-bit file.

UUD works the other way. It reconstitutes a 7-bit for to an 8-bit file.

PURPOSE: Some networks will only transmit 7-bits, so computer s/w usually needs encoding so that it can be UUEncode/SENT -> RECEIVED/UUDecoded without losing the data.

The original versions of these programs were written in 'C' for UNIX machines, but the code has been successfully converted to run as a UUE.TTP and UUD.TTP

When using UUE.TTP (I have a fairly new version for my own use, so the operation may be slightly different to what I do and what you do.), you double-click on UUE.TTP and enter the filename to be encoded. On my version, I can enter a command to create several files of UUEncoded data, each with a set number of lines.
Eg: To UUEncode a file called MYPROG.PRG I would enter in the TTP dialog,

MYPROG.PRG

If I wanted to create files that only had 500 lines in (512 lines is about 32K) I would enter,

-500 MYPROG.PRG

The reason for being able to set the file size (this in effect is what you are doing when you set the number of lines) is that certain mailers will discard the file after a certain amount has been read. (It is very difficult to give a perfect size, but I have not had any problems with using files of 512 lines.)

When using UUD.TTP, you would do exactly the same, except that you do not need to give a filesize. There is a different option available with UUD.TTP. It is

-d

Therefore, to decode a file,

MYPROG.UUE

If the encoded file is just 1 file. OR

MYPROG.UAA

Multiple files created by UUE are have the extendor .UAA then .UAB .UAC .UAD etc
When they reach .UAZ thy go to .UBA.......

The option -d gives details of what is happening when you are UUDecoding.
Eg.

-d MYPROG.UAA

will give something like this: (For the sake of an example, I am using a 3 part file. MYPROG.UAA .UAB .UAC)

```
Begin uudecoding: MYPROG.PRG
Sequence checking on. /* Notes for this */
Reading next section from: MYPROG.UAB
Reading part b
Reading next section from: MYPROG.UAC
Reading part c
Finished uudecoding.
End of file.
```

You would then have a normal copy of MYPROG.PRG

NOTES: You will see the phrase : Sequence checking on.
This is a sort of check that goes on inside UUD to make sure that it can keep track and prevent any errors whilst decoding. Some file are UUEncoded using an older version and do not provide this function. When UUDecoding, they give : No sequence checking.

That's about it.

You do of course have to ARC all the files you wish to send as all files get bigger when encoded. EG: A file was 8632 bytes. When UUEncoded into 1 file it became 12383 bytes. Not much agreed, but UUEncode a 250K demo, it becomes 358K. (Approx. values)

If you do not know how to use ARC.TTP then I will send you the help files. If you want them, please reply ASAP.

That's all,

Bye,

Gilbert.

630. Re: Transferring files.

Newsgroup: comp.sys.atari.st
Date: 1989-04-13 10:45:16 UTC
From: S82895@prime-a.plymouth.ac.UK
Message-ID: <8904131110.AA23710@ucbvax.Berkeley.EDU>
Source record: 249052

Hello Chris Edington.

Whether you need to just unARC those files, depend on whether they are UUEncoded or what. If they are, then read my other reply Re: UUE. which I sent.

I can send you the documentation for the ARC.TTP program if you want it. Either reply direct to me or to the digest.

I would offer more help, but as yet, I have not been very successful with getting anything out of BITNET. What server are you using, and what commands do you use. I have sent the following commands in a subjestless and without a disclaimer (See below) and I still get errors.

INDEX INFO-A16 or index info-a16
INDEX PROG-A16 or index prog-a16

and I get the return mail saying that both these lists are unknown by the LISTSERV.

Any comments other than those requesting for ARC documentation, please send to the digest.

Thanks,

Gilbert.

631. Re: TeX/LaTeX

Newsgroup: comp.sys.atari.st
Date: 1989-04-13 11:05:10 UTC
From: eykhout@wn2.sci.kun.nl
Message-ID: <417@wn2.sci.kun.nl>
Source record: 249053

From article <8904111313.AA05948@ucbvax.Berkeley.EDU>, by 01659@AECLCR.BITNET (Greg Csullog):
> One of the groups at my workplace is considering a Mega and an SLM804 with
> UltraScript; the group wants to know if LaTeX is available for the ST (I
> told them TeX was) and is there an SLM804 driver available (TeX/LaTeX without
> a laser driver would seem kind of pointless).

There are two German firms, Kettler and Tools, (Kettler seems to
be out of bussiness, but also seems to have been taken over),
that have TeX. LaTeX is included in both cases. Tools btw also have
Metafont. The Tools DVI.PRG has a driver for the SLM804.

However, if you are very picky where it concerns visual output,
there is a warning. The SLM is a write-white engine, and the TeX
Computer Modern font is very susceptible to damages. Thus the result
is not as good as, say, on an Apple Laserwriter. I have used both, so
I can compare them. If you have other fonts (the Postscript emulator
seems to be almost available) the problems may not be so bad.

Victor.

633. CDN MACHINES IN FRANCE?

Newsgroup: comp.sys.atari.st
Date: 1989-04-13 13:30:00 UTC
From: BOLLINI@HUSKY1.STMARYS.CA
Message-ID: <8904131234.AA27129@ucbvax.Berkeley.EDU>
Source record: 249055

Here's a simple question to which I can't get a firm answer. I'll be spending next year in Paris on sabbatical year (no expressions of sympathy, please: I'll just have to grit my teeth and bear it). I run a Mega4 here in Canada, and I'd like to carry the computer with me. Now the CPU and keyboard are quite portable, and present no problems; I'm told the computer will run perfectly from a transformer. But no one seems to be quite sure how to handle monochrome display. Can I buy a monitor in France and expect it to run with, say, a few sparkles? Or do I have to tote my monitor to get a display from my Canadian computer? Can I have the power supply replaced in Paris to run European monitors? And, incidentally, is there a problem with *ALL* European software on North American machines? Perhaps Ken B. can get some definitive statements from in-house gurus in Sunnyvale with respect to these questions: it can't be all that unusual to want to run a 110v, 50Hz machine in 220/60 lands. Many thanks for any advice from any of you, especially those who have done it.

634. help with internal compiler error in MWC

Newsgroup: comp.sys.atari.st
Date: 1989-04-13 13:53:32 UTC
From: benw@syma.sussex.ac.uk
Message-ID: <886@syma.sussex.ac.uk>
Source record: 249056

```
i am using MWC (v3.0) on an atari 1040 with two double sided drives.
when compiling the following, with the source on a 512k RAM disc
(of which some 300k is free) which also holds \tmp, i get the following
message:

In cc1: Internal compiler error::no match,op=61

code follows:

void foo(fx)
float (*fx)();
{
float fc,x=1.0;
fc=(*fx)(x);
}

my manual says "this shouldn't happen". does anyone have any ideas why cc1.prg
gets confused with the declaration

float (*fx)();
...
fc=(*fx)(x);

and any ideas on a fix ? i can also generate internal compiler error
op=69, but it looks like the same problem in a different quise.

i'd be most grateful for any help you can give me on this. i am snailing
a copy of this to mark williams co. but am hoping that i might get a
quicker response over the net (and that MW are listening).

From: BARRSTEVE@UNCG.BITNET
Message-ID: <8904131502.AA03702@ucbvax.Berkeley.EDU>
Source record: 249057

Oh, boy. UUE stands for uuencoded. This is a useful device for getting around some of the transmission problems 'net users face. It converts a file into a text file. This file can then be uudecoded back to its original form. I'll try and find the source and instructions for it.

P.S. if you have a PD Postscript to Runoff coverter you could make our school a better place.

Oh, yeah:
STeve Barr BARRSTEVE@UNCG BARRSTEV@NeXT.UNCG.EDU

636. Spectrum Holobyte & FALCON

Newsgroup: comp.sys.atari.st
Date: 1989-04-13 15:15:34 UTC
From: Xorg@cup.portal.com
Message-ID: <17109@cup.portal.com>
Source record: 249058

From GEnie:
Mr. Louie,

You did not in fact write your open letter to address the impact of piracy - you wrote your open letter *specifically accusing* the ST community as a whole as being the most tolerant of piracy. A quote directly from your letter:

> "In addition, ST pirates seem better organized and
> piracy seems more accepted (or, should I say, tolerated)
> by ST users."

Not only is this complete nonsense, but it is also highly slanderous. It paints a distorted and mythical image of the ST community. An image which I and many other ST owners have been fighting for YEARS to put to rest.

You also are completely ignoring the root cause of ST FALCON's previously slow sales - ADVERTISING. I have only a basic business education but I can tell you that without advertising NO product will sell. You quite erroneously state:

> "Some of you point out that we haven't taken out many
> ST ads."

The truth of the matter is that your company didn't take out *ANY* ST advertising before February of this year and you had ALREADY proclaimed that slow sales were due to piracy!! Do I really need to take you by the hand and go back through the message base to show you what you wrote?

> "Many of you feel that we should just shut up about the
> whole issue and go back to the IBM and MAC market."

This is nonsense also. I defy you to show us even ONE post where anyone has asked you to leave the ST market. What we would like you to do is stick to selling and supporting your software rather than posting slanderous 'open letter's in non-ST magazines that are based on nothing but rumor and myth.

> "FALCON ST has climbed to the top of the charts..."

Not only does this directly CONTRADICT what you have been trying to ram down our throats about piracy, but isn't this EXACTLY what I and many other ST owners predicted MONTHS AGO!! If you'd like me to, I can take you by your hand again and show you what you posted back in February when everyone was telling you that FALCON **would be** the

best-selling ST program and that your company had nothing to worry about.

[Items about advertising and editorial coverage, reviews...]
"So I can't buy your agrument that nobody knows about the product...]

Again, you are referring to items which appeared **AFTER** you had ALREADY proclaimed slow sales due to piracy and started spreading your 'open letter' to non-ST magazines. My argument was that the majority of the ST user base was unaware of FALCON's release due to your company's non-advertising and the lack of reviews. I pointed to that as the cause behind FALCON's slow sales back in January and February. Now everything is fine and sales are up to speed aren't they? Just like everyone here said they would be...

"Be realistic..."

I'm being very realistic. If you realized the damage that your letter is now causing the ST community in the computer world you would be quick to understand the outrage at your letter here on GEnie, on UseNet, and in FOREM FNET. If you were an honorable man you would post a retraction of your original comments or in the very least post an update or correction stating that sales have improved dramatically since the advent of advertising and press reviews.

I don't think this is a good idea unless it comes straight from MW. You
will lose compatibility with MWC sources otherwise.

>* Should I fix RSC2C so that it casts the field to a char pointer? I'm
> leaning toward the this alternative.

Yes. Please do not post the complete sources or the binary. Posting a
patch is acceptable. I will be creating a new version that will allow
you to change the type of cast made into ob_spec. This will probably
take the form of a command line argument.

Are there any casts other than (char *) and (unsigned long) that
should be included? Anybody?

> What does it take to turn a program into a desk accessory on the ST?
>
> - Steve Coco

First off, you need to replace the normal program startup code with a special (but simple) desk accessory startup module. If you're using a commercial C compiler, it should include such a module. If you're using Sozobon C, I can mail you DASTART.S, which I wrote and released several months ago.

The second requirement is that the desk accessory (a) register itself with GEM, then (b) go into an event loop in which it calls evnt_mesag() or evnt_multi(). This allows your DA to "go to sleep" until it hears from the GEM AES dispatcher.

Upon receiving a message from the AES, your desk accessory wakes up, checks to make sure the message is indeed intended for it, and then does whatever you want it to do -- using GEM and windows as necessary. That's it.

If the program you wish to convert is not a GEM application, you need to:
* manually save the top of the screen (the menu bar),
* open a GEM window the full size of the work area,
* hide the mouse,
* throw a VT52 clear-screen code at the console device,
* turn on the blinking cursor with another VT52 code,
... then run the bulk of your program.

After it's finished, you:
* turn off the VT52 blinking cursor,
* show the mouse,
* manually restore the top of the screen,
* close the GEM window, which causes the underlying application to redraw the work areas under it,
* return to the event loop.

Moshe Braner posted a nifty little skeleton program some time ago that does these things. I may have it here somewhere.

I believe that there is a requirement that your desk accessory not call the GEMdos function Malloc(). There may be a couple of other "gotchas" too.

Braner has put together a mutant MicroEMACS called GNOME that includes a desk accessory version. As you may know, MicroEMACS "mallocs like hell," in the words of a programmer friend. I believe he got around that problem by writing his own code that mallocs from a statically allocated internal buffer. Get the code; it's worth staring at.

Here is a little skeleton desk accessory that pops up a file selector (and does nothing with the results).

O/ cut here
=====O\==========

```
/*
* accskel.c
* desk accessory skeleton for Sozobon C
* link dastart.o, then this module, then the GEM bindings, then dlibs.
*/

#define MENU_ID "File selector"
#define AC_OPEN 30

/* these arrays are not needed for GEMFAST */
int contrl[12], intin[128], intout[128], ptsin[128], ptsout[128];

main()
{

int apid, menuid, msgbuf[8];
apid = appl_init(); /* say hello to the AES */
menuid = menu_register(apid, MENU_ID); /* add me to the Desk menu */

while (1) /* loop forever */
{
evnt_mesag(msgbuf);
if ( (msgbuf[0] == AC_OPEN) && (msgbuf[3] == menuid) )
wakeup();
}

appl_exit(); /* you'll never get here -- supposedly */
}

wakeup() /* display the file selector ... or whatever */
{
char path[128], defult[13] = '\0';
int button;
fullpath(path,"*.*");
fsel_input(path,defult,&button);
}

So did I. I had a good time, but was a little disappointed
with their display.

> My impression was that
> everyone who should have known for sure considered the 16 MB limit on disk
> partition size a dead issue (but the explanations varied).

Ralph ?, the guy that writes ST Report, is running a Beta
version of TOS 1.4 and is regularly running with 32 Mb
partitions, so I think it is a dead issue.

> The PC4, STACY and the Portfolio were spoken of as if the engineering on them
> was done, and production was imminent.

I was told that STacy would definitely be shipping is June.
I'll find out for sure when I go back for the CES in June.
I was also told that the CD-ROM was shipping now in small
quantities and would be pushed when more software (disks)
were available. I tried to find out if the 520ST and 1040ST's
were going to be distributed through mass merchandisers such
as K-Mart, Sears, etc. now that the MEGA's were in 1,2 & 4 Meg
versions, but no one would say.

|Easy,
| Use A-line instruction 10 $a i.e. opcode $a00a

That's also a good way to get the AES confused about how many times the mouse has been hidden/shown. The AES keeps its own internal count of how many times the mouse has been hidden or shown so that it can clean up after applications that go astray with the mouse. This AES count will get out of sync with the actual mouse state if you interleave VDI/line-A show/hide mouse calls with AES graf_mouse calls.

So the answer to the question how to kill a mouse cursor isn't all that easy. If your program uses the AES a lot, you should probably use the AES graf_mouse() calls to hide and show the mouse. If not, use VDI or even line-A. You could even disable mouse event reporting at the IKBD level if you wanted to go so far.

|counter or the VDI (?) code to show the mouse cursor no matter how many times
|it was hidden (which works otherwise) would fix the problem but it did not.
[...]
|The desktop does not have the problems my shell has. What does it do? I have
|tried all the leagal ways of fixing the problem that I can think of. Does the
|desktop do something illegal? But then that would actually be legal
|just undocumented. (Atari-speak)

The desktop, because it is an integral part of the OS, can get away with some things that applications just can't do. In this case, when launching a program, the desktop terminates, the AES shell runs the program, and when the program terminates, the AES shell starts up the desktop again. One of the first things that the desktop does, in order to clean up after "unclean" applications, is to re-initialize the AES window and mouse handlers. This is something that an application just can't do (legally...)

Until TOS 1.4. When TOS 1.4 becomes available, a new AES call will become available with it. The wind_new() call effectively does what the desktop needs done after an application has exited; it cleans up after the application, resetting the AES window and mouse handlers.

I'm sorry that I can't provide an easy solution to your problem, but that's why the wind_new() function was put into TOS 1.4!

Source record: 249069

Chris,
There is no guarantee that I am right, but the UUDECODE.BAS should be run on a file called UUD.UUE (or something similar). The .BAS file is NOT a complete working copy, just a temporary one so that you can get the proper version. This does make sense. If you run the .BAS on the .UUE (ONLY the UUDecode program), you should then have a valid UUD.TTP file. You can then UUDecode happily.

I think the .BAS file only does a very simple alalgorithm which has no REAL value outside that of de-encoding the original UUD.TTP file.

I hope this makes sense.

As I am a bit wary of my gateway, PLEASE send a reply specifically to me saying you received this mail. (Please give the date and times when you received it and the header ,so I can give a better pathway.)

Have fun.

Gilbert.

650. Re: Extended argument passing conventions in Pexec() [MWC]

Newsgroup: comp.sys.atari.st
Date: 1989-04-13 22:26:53 UTC
From: kbad@atari.UUCP
Message-ID: <1453@atari.UUCP>
Source record: 249072

In article <841@per2.UUCP> mwc.uucp!rec writes:
| My name is Roger Critchlow. I work for Mark Williams. I invented
| the MWC ARGV argument passing convention in October 1985. I don't
| think either of the proposed replacements is an improvement.
| ---
| Our convention is incomplete because you can't tell if the ARGV was
| actually passed by your parent or simply passed on by some intervening
| shell?
|
[environment comparison code omitted]
|
| This example is only the simplest of many procedural validations
| of the ARGV convention. You can chase the parent pointers all the
| way to the desktop and determine who exactly is responsible for
| each part of the environment in each of the processes active.

It is simple, yes, and it simply won't work. Using ARGV, a parent
is required to copy its environment before it execs a child. What if
someone decides they'd like to sort the environment variables for the
child as they create the child's environment? What if they want to
filter it? The environment comparison fails, and validation goes out
the window. The MWC tools already* provide a flag ("unreasonable"
command line length byte) which can be used to validate the ARGV, and it
is unused by the MWC startup code!

| I don't think that every program which uses ARGV needs be burdened
| with this sort of validation, but it's clearly possible.

One of the *main* reasons that xArgs came into existence in the first
place was that ARGV lacks validation that the arguments in the ARGV
pseudo-environment-variable really do come from one's parent. You may
not find the validation necessary, Roger, but there are many people
who use tools which were not compiled using MWC libraries. A typical ST
developer's toolkit contains sundry tools with a varied ancestry. The
plain fact is that ARGV does not peacefully coexist with tools that
don't use ARGV.

| ---
| Our convention is messy because it involves copying arguments around
| in the environment?
|
| But all three proposed argument conventions require copying, and all
| three pass linkage information in the environment, and the ARGV convention
| is the most efficient of the three.
|

[enumeration of implementation requirements omitted]
|
| The ARGS and xArgs proponents are proposing to load more code into the
| runtime startup to support their proposals. [...]
| How many independent count-allocate-copies does it
| take to start a Gemdos process?

Who cares??? How long does it take an 8Mhz 68000 to copy 1k, or even
(gasp) 2k of memory, even with extra processing to parse it? Somewhere
on the order of tens of milliseconds per program invocation, if that much.
God forbid that we should fritter away people's valuable milliseconds in
our wanton disregard of startup module code efficiency.

| --
| Programs which ignore the ARGV convention for arguments end up
| mis-interpreting ARGV specified arguments as environmental variables
| and passing screwed up environments on to their children.
|
| This problem is addressed differently by the ARGS and xArgs proposals.
|
[means of addressing the problem omitted]
|
| In article <156@np1.hep.nl> Geert J v Oldenborgh suggested truncating
| the environment after extracting the ARGV from it. I think this is
| an excellent suggestion: it adds one instruction, 2 words, to the
| runtime startup module and immediately cures one whole class of bugs,
| the class created by MWC compiled programs doing naive Pexec()'s.

Hah, I caught you! You admit that ARGV is imperfect! ;-) You are even
willing to change the startup code to make it more perfect!

| I have two solutions for binary programs which screw up the
| environment by ignoring the ARGV standard but cannot be rebuilt
| with the improved runtime startup. Both involve the same
| transformation suggested above.
|
| Solution 1 - call the program indirectly through a second program [...]
| Solution 2 - rewrite the binary of the offending program to
| incorporate the environment truncation into the offending
| program's runtime startup. [...]

That's very nice, but the other two methods of extended argument passing
don't require ANYBODY to be insulated from them. In fact, all THREE
methods can peacefully coexist in one system, except that ARGV will
cause problems for programs which haven't been "innoculated" against it.

| --
| In summary, the ARGV convention can be validated by comparing the
| ARGV received in the environment to the ARGV received by the parent;

unless the parent has done anything to the environment...

| the ARGV convention rides for free on Pexec() while the new proposals
| both involve additional overhead;

negligible additional overhead...

| and it is trivial to fix programs
| which pollute the environment by ignoring the ARGV convention.

perhaps we disagree on the meaning of the word trivial; in any case,
the other two schemes don't cause any pollution, and thus don't require
any programs to be fixed...

| If Atari wants MWC to discard the ARGV argument convention, I hope
| they'll wait until they can find something better to replace it with. :-)
|
| -- rec --

If MWC wants Atari to adopt the ARGV argument convention, I hope they'll
come up with some better defenses for it. >;-)

| What is required is something to read and interpret the Postscript code and
| output what the printing device is capable of understanding. That means
| that even old printers could be capable of Postscript, it just would require
| CPU time from somewhere, even if it was from your computer.

I played with UltraScript yesterday on an Atari Mega ST, which takes very-standard PostScript and interprets it for the Atari SLM804 Laser Printer (a dump-a-whole-buncha-bits-at-it interface -- no internal smarts).

I was pleased by the results. The few quick benchmarks I typed in at it placed it about the speed of a standard LaserWriter. Although the familiar fonts (except for Courier) were not there, I understand they can be purchased as a package.

I'm told that you can purchase a Mega ST-4, SLM 804, and UltraScript with all the expected fonts for about the same price as a LaserWriter. (~ $3500 or so.) You'd then have a printer that doubles as a workstation (and runs FlightSimulator at real-time speeds, and for $200 more runs Mac software faster than a Mac, and for $150 more runs IBM PC s/w off the shelf, etc, etc :-).

Note: I am not connected with Atari except as a happy owner of one of the first STs off the line. My brother, on the other hand, sells 'em.

I have been getting allot of mail about the DeskJet+ so I wanted to
post this information to answer common questions.

Here is a summary of the technical differences between a DeskJet and
a DeskJet+.

1. The DeskJet+ has an 8MHZ Z180 processor with 64K of RAM and 256K of ROM.
The DeskJet has a 4MHZ Z80 processor with 32K of RAM and 128K of ROM.

2. The DeskJet+ has a new paper motor that runs twice as fast.

3. The DeskJet+ has a different "sled" which allows a better priming
algorithm.

Note: These three facts imply that the basic parts needed to upgrade
a DeskJet are 1) a new logic board, 2) a new paper motor, 3) a new
sled. This also implies an upgrade is not simple and it would be
easy to blow up a power supply, smoke the new logic board, and break
a part of the sled assembly. On the other hand, I, a mere CS type have
upgraded 2 DeskJets to DeskJet+s and haven't broken or blown
up anything yet.

4. The DeskJet+ has twice as large an addressing space allowing for
twice as large ROM and RAM cartridges. Hence there are new DeskJet+
only font cartridges and there is a 256K DeskJet+ RAM cartridge for
soft fonts. (By the way, the DeskJet+ will download soft fonts
about 4 times faster than the DeskJet).

5. Due to the increased processor speed, increased RAM, and some other
hardware/software tweeks the DeskJet+ will print graphics from the
Centronics port 5 times faster than a DeskJet. When the serial
port is used the DeskJet+ graphics speed is limitted by the baud rate,
not the printer. WARNING: Your application probably cannot generate
graphics data as fast as the DeskJet+ can accept it unless you are using
a very fast PC or some very smart software. Hence the actual "speed up"
relative to a DeskJet is host and application dependant. The maximum
rate a DeskJet+ can do a page of 300DPI graphics is just about 1 page
per minute. The DeskJet could do 1/5 a page per minute (a page in 5
minutes).

6. Simple text is printed at 120CPS on both the DeskJet and the DeskJet+.
However the DeskJet+ can keep up with this maximum rate in more complex
cases (multiple fonts in a pass and so forth) as well as pick up and
move paper faster. Both the DeskJet and DeskJet+ are rated at 2 pages
per minute for text, but the DeskJet could only really do the most
simple text at this rate whereas the DeskJet+ can do more complicated
text at the same 2PPM rate.

7. The DeskJet+ has landscape mode built in, this is optional on the DeskJet. WARNING: The landscape support on DeskJet was intended for printing simple spreadsheets. There is no support for mixed text and graphics in landscape mode nor is there support for proportionally spaced landscape fonts via font cartridges. Hence if you primarily want a printer to do fancy spreadsheets with nice proportionally spaced text in landscape mode you would be better off with a laser printer. The technical reason proportional spaced landscape fonts are not possible is due to a hardware limitation of the chip that actually reads the font cartridges and renders the image on the page so there is not a software tweak I can make to workaround the problem. Hence if you get a DeskJet or DeskJet+ you should "write off" ever expecting to do anything real fancy in landscape mode unless its graphics only.

Now the DeskJet+ does do nice fancy spreadsheets (i.e. via Excel) in portrait mode, but not landscape. This warning only applies to applications and hosts that render text with the built in fonts. Hosts such as an Atari which only send out graphics and render the text images internally do not suffer from this same problem since in this case the printer only sees graphics and the PC does all the work of rotating, scaling, and so forth.

8. Due to changes in the internal hardware, the DeskJet Epson FX80 emulation cartridge will not work in a DeskJet+. There is a DeskJet+ version of this cartridge. This Epson emulation cartridge will print graphics 3 times faster than the original DeskJet emulation cartridge (which was comparable in speed to the actual Epson FX80).

9. The DeskJet+ supports internal fonts of up to 30 point, whereas the DeskJet supported fonts up to 15 points (technically 36 point for the Plus and 18 point for the DeskJet are possible but these fonts must have no descenders).

10. There is no difference in print quality or waterfastness between the DeskJet and DeskJet+ since this is an ink cartridge, rather than a printer issue. The waterfastness issue is getting allot of attention and eventually there should be a new waterfast ink cartridge that can be plugged into the DeskJet family printers but I cannot make promisses or give any time frames.

11. The DeskJet+ will retail for $995 and the DeskJet will now retail for $795. This is not a technical difference but it is significant. Personally, if you factor in the cost of a landscape cartridge for a DeskJet and an "A" (courier italics) cartridge which are both built in to the DeskJet+ the price difference is negligible. On a related note, we have price reduced our font cartridges by about 30%.

Presently there is no plan to offer an official upgrade to convert DeskJets into DeskJet Plusses. A supported upgrade would be expensive relative to the cost of the printer (could easily be close to $400). Although an unsupportted unofficial "roll your own" upgrade would be possible it would have no warranttee, and if you hook up a cable wrong and smoke a board you would have to pay again for any

part you smoked. Servicing such an unofficial upgrade might be difficult, however it would be hard to tell the difference between a properly upgraded DeskJet and an actual DeskJet+. Also if you use the DeskJet Epson cartridge you would need to buy a new DeskJet+ Epson cartridge.

I hope this answers most of your questions. I have been getting a flood of mail about the DeskJet+ which is fine but it has been keeping me quite busy.

> save the $30 that it would cost to have them open the case and find this out.
>
> Is this that common? Can something be done to prevent it? Is there some "safe"

I have a 520ST that does not have a memory upgrade. However that has
not prevented it from consuming three power supplies within a year and
a half. It is now on its fourth supply. At nearly $50 a pop
through San Jose Computer, what I buy when/if the fourth supply dies
won't be another power supply.

All the power supplies seem to have a production date code on them and all
of the ones that have died have been in the 8530 - 8535 range. The one it
now has has an earlier date code (maybe 8517, but I don't recall). This
supply is larger than the other three and has greater provisions for cooling
air flow. This latest supply has lasted the longest of the four.

My opinion is that the later dated supplies may be prone to early failure
because of reduced cooling. There may be other differences that could
account for a reduced MTBF, but I haven't taken this newest (oldest?)
supply apart to check (If it ain't broke....).

Anyone at Atari care to comment?

```
Hi,
I'm using the metafont program on my atari to generate some fonts for the
epson printer. All is right until the file punct.mf is treated, and I don't
understand the error message:

>> body_depth#
! Internal quantity `chardp' must receive a known value.
<to be read again>

What is chardp?

I'm very novice with metafont program...
Any answer will be very appreciated.

Yeah, I tried this on the Sun's in the office - it worked on all
of them except mine, which was the only one displaying "California
Beach Bums" (2 nude female behinds for those without Suns) as the
background - I wonder if there's some implication in this...

657. Double Sided Drive Fun

Newsgroup: comp.sys.atari.st
Date: 1989-04-14 09:46:24 UTC
From: c184-au@holden.Berkeley.EDU
Message-ID: <12415@pasteur.Berkeley.EDU>
Source record: 249079

In response to the question of whether reading in a SS disk, rearranging
the tracks in a DS manner, and rewriting the whole thing to disk is a good
thing...

I offer an alternative which I personally have been using for about two years
on my old 520 with DS, my new 1040, and my extra 5.25" 720K drive

Presenting here for your enjoyment and hopefully benefit.
:::: The Tim Mensch Special.

This hardware modification will allow you to use BOTH SIDES of a disk which
is current formatted Single sided. (Read 'copy-protected games').
This does, of course, require a double sided drive. If you don't have one,
you are definitely in need of one. Go buy one at once.

(Background info)
In the cable that connects the floppy drive mech to its nearest computer
component, there is a single pin that specifies SIDE SELECT. When the
Atari is using a SS drive, this signal is always (low/high : I don't
remember). When a DS drive is called into play, this signal alternates
depending on which side the computer is trying to read/write.
Nearly all games come on SS disks, wasting 50% of all disk storage and
causing immense numbers of floppies floating around.

(The tricky part)
Install a switch. The idea is, connect the DRIVE MECH side select pin to
either the Atari's side select pin or GROUND. (You decide!) That is, in
one swtich position, say, 'up', the drive is connected through to the Atari
just as it is now. NO DIFFERENCE IN OPERATION! In the second position,
'down', the drive gets GROUND as its side select, forcing it to write
to SIDE 2. The Atari still thinks that its signal is getting through...
so the computer acts just as though you have a single sided drive!

Uses of this nifty hardware mod :
1. Primarily backups/archives/pirate copies of protected software.
TWO SS DISKS worth of software can be now put on ONE DS disk.
Immediate savings of 50% disks.
2. EASE OF USE in multi-disk games. Copy DISK II of Game X onto SIDE 2 of
Game X Disk I. Thus, when "Please Insert Disk II" comes up, all you need
do is flip the switch! (Some games check for media change so you still
have to pop the disk in and out.. ugh ugh ugh.)
3. "Partition" your double sided floppies. (Makes two single sided disks
out of a double sided disk)

DISCLAIMER : I take no responsibility for anything that happens to anyone
as a result of trying this. I'm sure it will void thy <hahaha> warranty.

Since I don't remember offhand which pins in the cable need to be spliced together, I won't give any more detailed instructions as to how to do this... hardware hackers of the appropriate caliber should be able to easily reconstruct the entire setup, given info on cabling to the drives. Or just write me mail and ask me how to do it. I've 'done' three of my own drives and about three other people's. You could get someone else (say me) to do it for you, but this is an easy enough hack that anyone who can solder can do it.

I have had NO trouble whatsoever with this mod over the years. Since it is totally transparent to the ST, no software will not work with it. (I can imagine cases where a protection scheme might try to access the otherwise unused back side of a disk, but that wouldn't work on a SS drive anyway...)

RECOMMENDATIONS : When you drill a hole into the case of your 1040/520F, Don't put the switch in the obvious place, one the side of the computer, next to the drive itself. You will note that this is in the TOP half of the plastic case and the cable to which
you must run wires is in the BOTTOM half. Thus, every time you need to open your machine up, you will forget and yank the two apart, thus causing significant strain on your switch/cables/soldering job. I have just moved my switch around to the back of my machine where the RF modulator should have been.. for SF314 mods, I'd say, put it in the front, on either side of the disk slot. It's up to you.

HISTORY : This was thought up and tested by Tim Mensch, an awesome programmer and fairly good hardware dude. Thanks, Tim!
(Tim and I go way back...)

There. I think I've said everything. Get a SPDT switch, (I got mine at Radio Shack)... sever the appropriate pin of the ribbon cable to the drive, center switch connection to the DRIVE side select, one side to
the atari side select, and one side to a ground. (Odd numbered pin in the 34 pin cable will do fine) (I think it's pin 32 of the 34 pin cable that is side select.. look it up, and double check before doing anything drastic.)

Source record: 249080

Hi everybody (Steve Grimm in particular),

I've finally got my formats correct for accessing the ssyx archive, and have managed to get some stuff from there. However, reading the "Fairness" message, where it said that it would be better to have all requests in one message than have a load of different messages, I did this and sent it off (about 3 weeks ago) and obviously, haven't had any back yet.
I wonder if it is possible for anybody to kill my requests on the ssyx queue and notify me so that I can request one at a time, wait for it to arrive etc. before requesting another.
Just a thought concerning the (seemingly) heavy usage of the archive, would it be easier if anybody who wanted anything ask all on the net if they have it and if so to send it? I realise that it could end up with the requester (??) getting a load of the same stuff or alternatively, if when somebody gets a big piec of software from an archive, informing the net for info. I kniw that I wouldn't mind doing this, any thoughts from anybody else??

Read from you soon,

GFA Basic is a commercial product and should not be distributed (or
solicited) freely. Version 3.0 is currently for sale at your dealer.
Version 2.0 was distributed with STart magazine several months back, so
it is very cheap, but I do not believe that it is in the public domain.

662. Folding Editor - Comments Anyone?

Newsgroup: comp.sys.atari.st
Date: 1989-04-14 15:27:08 UTC
From: trb@stag.UUCP
Message-ID: <786@stag.UUCP>
Source record: 249084
Cross-posted to: comp.sys.atari.st,comp.editors,comp.misc

This is a request for comments on an editor which will soon be released
for public abuse. I hope to release the sources to comp.sources.unix
in the near future, but what with taxes and real work (the kind that
pays the bills and causes the taxes) I can't commit to when that will
be. The code is pretty complete (i.e. all the version 1.0 features that
I want are currently in it) and reliable. I use the editor now for most
of my daily editing activies both at home and work and have gotten over
the habit of saving my files every minute or so :-).

I don't want to start an editor war or arguments over which type of editor
is best. I am simply interested in hearing 1) which FOLDED features people
like and 2) what they would like to see added. Also, if anyone sees any obvious
shortfall that I may have missed, now would be a good time to let me know.
To this end, I am including part of the documentation that I am putting
together for FOLDED. Sorry, but this is kind of long.

-Todd Burkey
trb@stag.UUCP
or tburkey@eta.com

-------------Partial Draft of the FOLDED Documentation-----------------

FOLDED
A folding editor
(c) 1989
By Todd Burkey

FOLDED is a dual mode editor that provides several advanced features
not currently found in text and programming editors. FOLDED is primarily
intended to be used as a source code editor. As such, it incorporates
a folding feature similar to that found in thought processor programs
but with added support for the C language (and eventually Pascal). FOLDED
also has some relational capabilities. These allow the user to associate
lines in their source files with sections of their documentation files
and vice-versa. And both folding and relations are incorporated in such a
fashion that they don't impact the original text files in any way.

FOLDED also has the standard set of editor features, with a few bells and
whistles thrown in. It has dynamic 'as-you-type' searching, substition by
block/global/direction of a string or exact word match (i.e. change
variable i to i_var throughout your code), block copy/move/kill in normal
or rectangular region modes, marks that allow intra-buffer movement, easy
movement between buffers, a trash can, variable skipping (point to a
variable, press ^n to skip to the next occurrance of it, ^p for previous),
configuration save (you can leave a multi-buffer edit session and come

back to the exact place you left off with all buffer positions restored), built in help, prompting for the beginning user, one-key buffer cloning, and more.

So what doesn't FOLDED do? Well, the first release will not have an UNDO feature. The trash can will have to do. It also is dual mode, something which may alienate some of the Emacs users out there (I am bi-editable, since I use Emacs on some systems, graphic shell editors on others, vi on still others). With a little work, the editor could actually be made to work either as a dual mode editor or a single mode editor (hint to hackers out there). It also could use some better screen optimization, since I tended to develop it on high speed displays. It is usable at 2400 buad, but any slower than that and you are better off with ed. The first release also won't have any key binding capability. I still haven't decided upon the best approach to handle user-defined key maps. Finally, FOLDED isn't a layered editor. My goals during the development of FOLDED were to keep it relatively small (it is about 60K executable, <5000 lines of source) and fast, so layering as implemented in emacs-like editors was out.

I wrote FOLDED simply to learn. Early on, I made a choice to 1) put basic 'must-have' functionality in the editor, 2) put advanced concepts into the editor that can't be handled by external programs (folding and relational features), 3) implement a simple to use and understand multi file editing capability so that moving between files and scratchpads was easy, 4) design the editor so that I could add enhanced 'wish-list' functionality as I determined I needed it, 5) ensure that the final version of the editor would function the same on my Atari ST at home as it does on the Sun workstations at work and even as it does on the mainframes, and 6) keep the program small (I hate long loading times). The latter requirement somewhat dictates the earlier ones...at least for the first release. I imagine that the editor will continue to grow unbounded in the future, since it is just too easy to add features as I feel a need to. One thing that I will eventually look into is a bindable user macro feature (not interpreted like in emacs, but really and truly bound into the executable.) The reason will be simply speed, speed, and more speed :-).

FOLDED differs from both emacs and vi in several ways. First, it is an unconstrained editor. You can move your cursor anywhere on the screen and when you go into insert mode (or copy a rectangular block of text) the editor will take care of sticking in needed spaces. Another difference is that the editor does not 'wrap' lines. Instead, you can scroll/page the entire window sideways when necessary (the editor will do this for you if you are typing past the end of the right margin). I got too used to this feature on the Apollos, I guess. Also, FOLDED does not retain tab characters. Rather, they are replaced with white space on input and FOLDED will optionally 'optimize' your file when you write it out (i.e. inserting tabs wherever it can, removing trailing spaces on lines, etc). Actually, FOLDED doesn't even retain leading spaces in the way you might expect an editor to store them. All leading spaces in a line are compressed to an integer variable upon file read-in. The user

still sees the spaces on the screen, but internally this sped up my folding logic (at the cost of almost going insane over the added code complexity... there is always a tradeoff).

The first release of FOLDED has been tested on BSD4.2/3 (Suns, Symetric, and Apollo), SYSVR3 (ETA-10), and the ATARI ST. It is being ported by others to the Mac and the IBM PC. A preliminary port of the code to the BELLCORE MGR (window manager) environment took only two hours on a Sun workstation and provided individual windows for each buffer (with title bars).

The following sections discuss the concepts of folding, relations, and a little about the primary commands and user environment of FOLDED. Although most of the examples will be source code related, I should mention that I find myself using folding and relations in my documentation and daily work plans and status reports even more than I do while coding.

FOLDING:

Obviously, a fundamental concept in using FOLDED is that of folding. Folding in a text editor is a mechanism that allows you to cause sections of code or text be replaced by a single line of text. This is useful for 'hiding' away clean and functional sections of code while you work on and only see the parts that you are currently debugging. It also proves useful for tucking away big comment blocks.

Worried that folding will change your source code? Don't worry, the act of folding doesn't affect the edited file at all...even when saved. When you save a file that has folds in it, a seperate control file is also saved under your current directory. See the section in the documentation titled 'CONTROL FILES' for more info on this.

In FOLDED, I implemented three types of folding. In each case, a segment of your file is reduced such that all you see is the first line of the segment in reverse image (or bold, depending on your standout terminal mode). First, is the simple 'fold a marked block'. This allows you to mark any arbitrary region of text and fold it away. For example, lets say we had started with the following text (the numbers are just for reference in this documentation):

```
1: main()
2: /* GID for main - Just a test case
3: Author: Todd Burkey
4: Date: 1/27/89
5: DESC: Methodology for a test case
6: */
7: {
8: if(this==that) {
9: do_something_that_works();
10: }
11: }
```

By defining a region between lines 2 and 6 and then folding, what you would see on the screen would be:

```
1: main()
2: /* GID for main - Just a test case <-pretend this line is bold
7: {
8: if(this==that) {
9: do_something_that_works();
10: }
11: }
```

Another method of folding is that based on 'indent level'. The logic behind indent level folding is simply to start with the line the user is currently on, move down in the text until an indent occurs, and then continue down until an undent occurs that is less than or equal to the original lines 'indented' position. For example, if you had been on line 8 in the above 'folded' text when the 'f' key was pressed, you would see the following:

```
1: main()
2: /* GID for main - Just a test case <-pretend this line is bold
7: {
8: if(this==that) { <-pretend this line is bold
11: }
```

Unfortunately, most source code contains lots of things that tend to break up the clean indentation levels, so I added a third folding mechanism. This one is a little smarter in that it does a 'logical fold'. A logical fold looks for logical block begin/end marks in the code (the braces in C) and skips around comments, strings, etc. For example, if you had pressed the 'F' key on line 1 in any of the above steps, you would end up with:

```
1: main() <-pretend this line is bold
```

In all cases, unfolding the text is performed by simply moving to the folded line and pressing the 'f' or 'F' key.

Folding isn't all that novel a concept. It has been used for years now in thought processor programs on the Mac, IBM PC, and even back in the CP/M days. Thought processors usually use the 'fold by indent level' technique. Take the following simple example:

```
FOLDED Information
* specifications <-pretend this line is bold
* plans <-pretend this line is bold
* problems <-pretend this line is bold
```

This is all I see when I use FOLDED to call up my folded.info file. Now, if I move to line 3 and press the f key, I will see:

```
FOLDED Information
* specifications <-pretend this line is bold
* plans
```

- Documentation <-pretend this line is bold
- Enhancements <-pretend this line is bold
- Bullet-proofing <-pretend this line is bold
* problems <-pretend this line is bold

In summary, folding is fully heirarchical (i.e. a fold can contain any number of folds), it is smart (it can fold based on programming logic blocks and indentation level), and it is retained from one edit session to the next. The actual commands (and their associated key bindings) that involve folding are:

indent fold (f) : fold based on indent level logic
smart fold (F) : fold based on {} logic
unfold (f or F) : unfold the fold under the cursor
temp unfold (^f): temporarily unfold all folds (for searching/sub'ing)
re-fold all (^f): yep, CTRL-f is just a toggle
block fold (bf): fold current block region

RELATING:

The word 'relations' in the field of databases conjures up images of opening up a large database, finding a particular entry, moving to a particular field, and, with several keystrokes, calling up not only another database, but a specific record in that database. Now, I have never understood why we couldn't have similar capabilities in a text editor. We can envision having a document file, moving to a specific part of the document, calling up the source code file related to that part of the document, and then moving to the appropriate spot in the source file. We can even imagine moving through the source code and finding a structure (or variable) and wishing we could immediately view the definition of the structure. These scenarios are fundamentally the same as those handled by a relational database program.

Relationships as pertains to editors (and, of course, in this context, FOLDED) primarily involve two concepts. First, there are word relationships. These are something like 'glossary' entries in that you define a word once in a file and then can immediately go to the exact place you defined it from anywhere in the file (or any other file you are currently editing.) From a programming viewpoint, this simply means that you can move your cursor over a structure name in a source file and with a few keystrokes be placed immediately in an include file at the place the structure is defined. A second relationship type is that of line relations. These are basically invisible links that relate a line in one buffer to a line in another buffer. This type of relationship allows you to easily move back and forth between source code and program outlines/documents. Folded will even open up a file if you try to go to a relation in a file that you aren't currently editing.

FOLDED supports a number of commands that allow easy creation and use of these relationships. The following key sequences are used to perform the most common relation operations:

Rsl (Relate Set Line): The current line becomes 1/2 of a line relationship.
The next Rs command will complete the relationship.
Rsw (Relate Set Word): The current word is indexed for reference.
Rgl (Relate Goto Line):FOLDED looks at the first line with a relation on or
above the current line and goes to its related line.
If the related line is in a file not currently being
edited it will be opened for viewing.
Rgw (Relate Goto Word):Read the word under the cursor and move to the correct
file that it was defined in.
Rkl (Relate Kill Line):Kill the relationship for the current line.
Rkw (Relate Kill Word):Kill the relationship for the current word.
Rp (Relate Pop): Pop back to where you were before the last Relate Goto.
The pop stack is currently 10 levels deep.

As with folding, the relationship information does not affect the actual
files you are editing. In fact, the information is simply saved out as part
of the folding info files. It is also important to note that neither folding
or relations affect the speed of loading, saving, or using the various editor
features to a noticable extent.

Since I added relations very late in the development of the editor, I have a
feeling that this area will see the most improvement over the next year. I've
already decided that I need a few more commands to do things like 'move'
and 'view' relationships.

EDITING COMMANDS:

When you enter FOLDED the first time, press the ? key to see a cheat sheet
that tells you what each key does. Sorry, haven't had time to document the
commands in detail yet...

The following is a roughly what you will see on the cheat sheet screen
(less the standout boxes):

Top level cheat sheet for FOLDED.
Where appropriate, additional prompts will appear in the program.
MOVEMENT: k-up, j-down, h-left, l-right, K/J/H/L for page movement
^/$-beginning/end of line, p-Toggle paging mode, g-goto a line
READING : :r/:v/:i-read/view/insert file, ^r/^v-read/view under cursor
WRITING : :w-write current buffer/block, :s-save changed buffers/config
INFO : ?-this help, '='-local information, X-extended buffer info
SEARCHES: ^n/^p-find next/prev word, /-forward, \-reverse, ^e-exactmode
BUFFERS : t/T-toggle buffers/trash, ^g/' '-goto/Cycle through buffers
c/C Create scratch/clone buf, ^b-tag buffer for moves/copies
'-k'-kill current buffer, y-yank line from trash and insert
BLOCKS : b-Go to block options (define start/end, moving, copying, etc)
CHANGING: s-change one char, S-substitute a string/word (once or global)
DELETING: d/D-delete a character/line, -v/-d: global delete/vdelete
INSERTS : i/I-insert before char/line, a/A-append after char/line
FOLDING : f-fold by indentation, F-fold by logic, bf-fold a defined block
^f-toggle unfoldall, NOTE: press f or F on a fold to unfold it
RELATES : R-line, word, and error relation options (set, goto, kill, pop)
MARKING : m-mark options (ms-set, mg-goto, md-delete, mc-clear all)

EXTRAS : Q-quit, !-run program/shell, x-execute macro (unimplemented)
--Hit any key to continue--

BACKUP PROTECTION:

If FOLDED detects a local directory called febackup, then backup copies of anything you edit will be placed in that directory. A rename operation is performed on the original file, so this means that only local partition files will be backed up in this fashion. Backups only take place at the time you save a file the first time during an edit session, so no unneccessary backups are made.

FOLDED CONTROL FILES:

If folded detects a local directory called foldinfo, then FOLDED will store all its control files there rather than clutter your directory with them. A control file is created only when the file being edited is saved and has some folding or relations in it. The control file will be a file of the same name, but with an 'f' inserted immediately after the final '.' in the name...so 'test.c' has a control file called 'test.fc' and 'junk' would have 'junk.f'.

ENVIRONMENT VARIABLES:

Several Environment variables may be used if you wish to avoid some prompting by FOLDED. They are:

FE_ASCII - Save control files in ASCII (easier to mail that way)
FE_BINARY - Save control files in BINARY (a bit faster and more effecient).
FE_NOTABS - Always write files without tabs (useful on the Apollos).
FE_TABS - Always fully optimize the files when writing.
MGR_FONT - Size of the font used under MGR for the windows.

IMPLEMENTATION DETAILS:

Folded uses a doubly linked list to store lines internally. It mallocs the exact amount of memory a line needs on read-in, but as you modify lines it will malloc additional memory in 4 byte chunks...so you can end up with some wastage if you edit a lot of lines in a file. FOLDED keeps track of a lot of information about lines in the buffers, so there is quite a bit of overhead in using FOLDED. I place it pretty close to emacs in the amount of overhead required for 'data' storage, but since the executable is only about 60K it wipes emacs away in raw loading time (program+files). I haven't had time to optimize the code for speed yet, but things like searching and substituting are significantly faster than emacs and slightly faster than vi. This is partly due to the design of the editor and also may be due to FOLDED's lack of regular expression parsing routines.

The first version of FOLDED probably won't be heavily optimized in the sense that ints will probably still be used where chars may get by. Also, there may be tricks I don't know about that could compress the amount of overhead I incurr in the storage of lines, buffers, etc.

> save the $30 that it would cost to have them open the case and find this out.

I've used several STs with memory upgrades (both piggy-back upgrades on 520s to 1 Meg and Aerco upgrades to 4 Meg). Most have ulitmately had problems of some kind. Several of the piggy-back units ultimately developed bad solder connections which had to be fixed. The Aerco units developed problems due to the stupid "no soldering" connection scheme, once every thing was soldered they worked fine.

I used my 520 upgraded to 1 meg for almost 3 years before I sold it. It worked had no problems other than the normal loose chips that all STs have. The machine is still in daily use and is still working fine (I sold it to Dave at Gadgets by Small). Gadgets by Small has a 520 with an Aerco 4 meg boards. It developed problems (loose connections, etc.) after about 18 months. But the ST it was in was in really bad shape to begin with (several custom mods used for debugging the Spectre).

If your service center is telling you that any memory upgrade is going to damage your computer so badly that the only fix is a motherboard swap they are either very lazy (swaps are easier) or they need more money. I'd suggest looking around for another service center. You could just pull the Aerco board out and let them swap the motherboard or send it to Atari yourself. (Atari had a policy to exchange motherboard for fairly cheap, call them and see what the current setup is.) Then put the Aerco board back on the new one.

665. problems with uniterm

Newsgroup: comp.sys.atari.st
Date: 1989-04-14 17:06:00 UTC
From: TOXI_CE@HNYKUN51.BITNET
Message-ID: <8904151026.AA10402@ucbvax.Berkeley.EDU>
Source record: 249087

Distribution-File:
"info-atari16@score.stanford.edu"

I tried to send this message directly to Simon Poole, but probably
did not succeed. (Is that your real BITNET address, Simon?).

1) I am using UniTerm (V2.0e-010)at 9600 baud on a 1040 STf with TOS 1.2. I
like UniTerms feature to position the cursor with the mouse. However this
feature does not allways work. I tried to chance the mouse respons with the
control panel, but that does not seem to make a lot of difference. What does
make a difference is entering UniTerms help menu (you must choose one of the
menu options actually). When you do that double clicking suddenly starts to
work.

2) We did find a small problem in the XON/XOFF protocol. When we use
the XON/XOFF protocol (because we use the connected printer) problem occur
when the computer is turned off or reset after an XOFF has been send. When
UniTerm is restarted, no XON will be send. And the host will keep waiting
for it. It is possible to overcome this problem by using hold screen. When
hold screen is released, UniTerm does seem to send an XON. Maybe it would
be a good idea to have UniTerm send an XON after a reset.

3) I tried to use the write to VDI device option (and succeeded). However, I
have a few questions remaining. Why does UniTerm need device 00 as screen,
other applications use either 01 (the default screen; Timeworks does this) or
look for the actual resolution and use the corresponding sreen-driver (Eazy
draw does this). UniTerm will not work when device 00 is not known (it will
even say that GDOS is not loaded, while it is and while both EAZY DRAW and
Timeworks work correctly). After I put 00 in the assign.sys file it worked
allright. However, text (written with the Tektronics font, not as vectors)
was not printed. I did put the Timeworks fonts in the assign.sys file,
both with the printer driver (LQ800.sys from timeworks for a NEC P6 printer),
and with the three screen drivers. Am I doing something wrong? Or does the
write to VDI device function ignore text.

> useful function if I could get it to work!

I had the same problem when I got my new hard drive. It does, indeed, seem to be a problem with the clock-setting software (I use Supra software even though my drive is a Micropolis 1335 with a BMS 200 card).

There are actually 3 clocks in the ST. They are the keyboard clock, the TOS clock, and the BIOS clock. Some hard drives set only one clock. My BMS card sets only the TOS clock. If I remember correctly, I think WP uses the BIOS clock (a leftover from PC days, perhaps?). Since the BMS clock only sets the TOS clock, my time and date in WP are screwed up (Jan 20 20??, way in the future).

To fix this irritating problem, my husband wrote a small program in Mark William's C that sets the BIOS clock. Since it's a small program, I'll include it here:

```
/* set all clocks according to TOS time */

#include <time.h>
#include <osbind.h>

main() {
tetd_t td;

td = ((long)Tgetdate()<<16) | (unsigned)Tgettime();
Settime(td);
Ksettime(tetd_to_tm(td));
}
```

That's it. Try it out and see if it works. Run it *after* you've run your setclock program.

I have for sale an Atari 520st with external single-sided drive, monochrome monitor, and 1 meg memory upgrade. I am interested in selling this along with the following collection of software (all with packaging and manuals).
Dungeon Master
Flight Simulator II
Captain Blood
Moebius
Ultima III
The Pawn
Barbarian
Universe II
Personal Pascal
Plus a wide selection of public domain software.
I am asking $500 for the complete set where I will pay shipping within the USA. Please respond via e-mail to
lorraine@msc2.tn.cornell.edu
or via phone in the evening at (607) 273-6457.

>Does it have a speaker?

I have the Supra, and an older version of Flash. The Supra is, as far as most programs will care, completely Hayes compatible. I believe the only differences are in the S-registers. Yes, it has a speaker. I have had it for just about a year now, (bought it at the West Coast Computer Faire last year) and have had absolutely no problems with it. It seems to be fairly immune to noise, even at 2400 baud, but my phone lines are not particularly noisy, so your mileage may vary.

I don't think you can do any better for the price.

(Is it *really* necessary to say that I have no financial stake in Supra Corp.? No? Good. (-:)

Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

From: "Information Week" - Issue 215 (4/10/89) Pg. 36

Atari Computer began shipping Portfolio, a 1-pound MS-DOS
machine. Retailing for $400, it's expandable to 640K, runs
on AA batteries, and offers an 8-line, 40 char. LCD display.
The handheld unit comes with a text processor, Lotus 1-2-3
compatable speadsheet, and built-in modem.

This is the first I've heard of this. Thought the rest of you Atarians
would like the news as well.

Signed,
Marcus "Orphan Computer" Prickett (I keep my 800XL next to my TI99/4A :-})

>
> -- rec --

This is the root of the problem, isn't it? There's no validation of the arguments. It could be that the program's PARENT was executed by msh, and the program itself was executed by something which didn't know a thing about ARGV.

If every MWC tool and ARGV-compatible program checked to see if the "ARGV" in its environment was really meant for its use, we'd have much smaller objections to ARGV.

As it happens, the person(s) who wrote the execve code for the MWC library DID leave a hook for validation: they made sure the command-line length byte held 0x7f, which is the highest possible number this byte can legally hold. I always assumed the MWC startup code could say, "If my command-line length byte isn't 0x7f, the ARGV in my environment can't be meant for me."

Then ignorant programs which simply passed ARGV on to their children wouldn't be harmed, because the children would know that the args aren't meant for them. The other problems of ignorant programs finding strange things in their environments (each "argument" string appears as a separate environment variables) are minor by comparison.

From: logajan@ns.network.com
Message-ID: <1282@ns.network.com>
Source record: 249099

Would anyone who has seen DeskJet output and laser printer output care
to compare them qualitatively for me?

Two specific cases:

1.) Do DeskJet fonts look like they are letter quality?

2.) Are DeskJet graphics sharp and consistent -- something you wouldn't
mind taking to a printers for mass production copying?

Thanks,

678. Midi questions

Newsgroup: comp.sys.atari.st
Date: 1989-04-15 00:19:00 UTC
From: jrd@STONY-BROOK.SCRC.SYMBOLICS.COM
Message-ID: <19890415001925.6.JRD@MOA.SCRC.Symbolics.COM>
Source record: 249252

Can anybody out there tell me the "right" way to read a bunch of midi data? I have some code that reads byte-at-a-time using Bconin(3), and that works until I tell my synthesizer (a Kawai K1) to dump its whole patch database. That apparently causes buffer overruns inside the ST, as the first few patches come thru ok, but the rest is gubbish. Transferring small amounts of data works.

In the OSBIND defs, I see Mfpint; is that something to do with getting MIDI interrupts for incoming data?

Also, about a year ago, a fragment of C code called midisys flew by on this list; it appears to be low-level interrupt handlers that hack the ACIA directly. Anybody remember it, used it, etc? One of the things it does is snag a batch of vectors with Kbdvbase() and grab the MIDI one; does anybody know which one that is?

Finally, code fragments, in any language, would be welcome.

Thanks in advance for any and all info.

Source record: 249257

Commenting about a high density DEGAS printer program, John Kawakami says:
>Please, DON'T USE THIS PROGRAM! DENSITY.PRG will almost certainly destroy
>your printhead. There must be a better way, like using all 8 pins, pushing
>the paper 2/3 a dot, and making another pass. Each pin will do 1/8 of the
>work.

Actually, DENSITY.PRG allows you to select which pin is used to make the printout, and the Help File instructs you to rotate the pin used for each printout done... assuming you did 8 pictures and selected a different pin each time, each pin would end up doing the same amount of work as if all 8 were used..

Of course, it's up to the user to remember to change pins, and the real problem would arise when you only wanted to make one printout and didn't bother to change pins before doing it..

On the other hand, the program works well, and is available now...

From: 870646c@aucs.UUCP
Message-ID: <1800@aucs.UUCP>
Source record: 249259

Well here is the pin connections for hooking up a Commodore 1084 monitor to the ST computers. First off you are doing this on your own and are taking all the risks(I guess that you need this type of header).

The cable that I used is from Practical Solutions, which is a nice cable all shielded and has the ST connector already hooked up. Also included is the pinouts and their corresponding coloured wire.

ST pins number Commodore 1084
6-GREEN-RGB 1
7-RED-RGB 4
9-H SYNC 2
10-BLUE-RGB 5
12-V SYNC 6
13-GROUND 3

That is all there is to it, remember to hook the shielding up to the outer shield of the 6-Pin Din plug on the monitor end. You can pick up the Din plug at Radio Shack for two bucks or so. It works for me, if you are not sure about doing this yourself GET SOMEONE ELSE TO DO IT FOR YOU!

later
Barry Comer 870646c@aucs.UUCP

P.S. Also remember that the ST should be plugged into the ANALOG(?) RGB port.

689. CLock chip

Newsgroup: comp.sys.atari.st
Date: 1989-04-15 15:36:22 UTC
From: derrick@ritcsh.UUCP
Message-ID: <2807@ritcsh.UUCP>
Source record: 249263

SOme people have asked me to post the details of a clock chip I mentioned
a while ago.
While there are many clock chips available, some in hard drives and some
easier to use, I believe this is the cheapest method anywhere.

The chip upgrade is detailed in ST X-Press magazine, April 1988. It is
relatively simple.

The chip itself is a Dallas Semiconductor DS1216E Smartwatch. It is important
to get the one with the E postfix for it is the only one that will fit the
ST.

Once you have obtailed this chip (DS address at bottom), you open the case
of your 520 or 1040, remove the rf shield, pull out the chip marked U2, put
in the DS chip, and put in the U2 chip back on top of the DS chip.
That's it for the hardware. However, it's a little tricky on a 1040, since it
is directly below the power supply. You will have to cut a hole on the mounting
bracket, but it is a simple operation. Make sure you put eletrical tape on the
top of the chip so it won't come into contact with the shield or the power
supply.

You need to have software in order to boot up the chip and set the time. It is
public domain (I got it off the disk that came with the magazine). This has to
be in the auto folder on the disk you boot up with. This is no problem if you
have a hard drive, but can be a pain if you're operating on floppies. I just
put the program on the program disks where time/date stamping is important.

Please remember that opening your computer will void your warranty, and while
this chip installation is very simple, I can't take any responsibility
for any mishaps that anyone might experience.

As for the chip, possible resources might be your local electronics store
or even (heven forbid) Radio Shack. If you're stuck, call

Dallas Semiconductor (214) 450-0400 (Sorry, no address available).

Prices range wildly from $15 to $40, so look carefully for the cheapest source.

Dallas Semiconductor provides software for the IBM (Use it with PC Ditto).

For the Atari software, contact:

St Xpress
P.O. Box 2383
La Habra, CA 90632
(213) 691-8000

Or reply to this posting and I will see if I can send it to you (I'm sure that the software can be distributed legally).

Happy Hacking!

Derrick

An artsie and an Engineer once sat, 'twix them a gallon can;
Said the artsie, "Match me drink for drink, let's see who's the better man."
They drank three quaffs, the artsie collapsed with a face turning green,
But the Engineer drank on and with a sneer said, "It's only gasoline!"

>
>THEN she said that she had seen "a lot" of ST's with fried main logic boards
>and some power supplies after about 18 months of using an upgrade board, and
>that the only corrective action is total replacement of the CPU.

The only thing I can think of is that the 520's have a problem getting
rid of the extra heat, which might effect the CPU. (The only other effect
would be on the power supply, which can *definitely* handle the
extra memory.

I modified my 520 myself to 2 Meg over 3 years ago, without an add on board.
(There weren't any back then.) I use my ST a *lot* and I have never
had a problem with it...no mechanical or electronic defects at all.

I dunno if that helps or not...but I haven't heard of an epidemic
of blown CPU's due to memory board upgrades before...

>damn mice get the biggest complaints.
Well, you do have to use them on the optical pads.... but there are some
advantages with this. One that I can think of is related to something that
someone recently posted to the net-- if you had an optical mouse on your
atari, no matter how zealous your game playing got, you would not wear out
the roller-ball because there wouldn't be one. On the other hand, I don't
want to have to pay hundreds of dollars to get a new ST mouse in the event
that something DID happen to it.

>2) If you want to be silly, put the mouse on the screen. The cursor
>will FLY up to the top of the screen. As far as I can figure, since
>the mouse is optical, it mistakes the scan lines as one of those black
>lines on the pad.
I use this to my advantage...
If you have to do work and the lab is full... well, it is almost full--
every sun is taken except for the one with the broken mouse.... well,
you can still use the machine if you want to move the mouse around by
putting it to the monitor!

>Now as for the Atari mouse, I've seen better and worse. Luckily, I have
>the Japanese mouse, so I have had no major problems with it after 2
>years (except for replacing the left button). Has anybody experimented
>with putting a different switch in it to get more feedback?
I don't mind the mouse as much as the MORONIC location of the jack!
Personally, I bought a joystick extender-- that 5 foot joystick extension
cable. I have that plugged in all the time so whenever I want to switch the mouse with a
joystick (or the other way around), I don't have to move my entire
setup!

In article <4934@kuhub.cc.ukans.edu> shawl@kuhub.cc.ukans.edu writes:
>As an ATARI ST user, and a professional scientist (astronomer), I have often
>wondered how many other professional scientists use an ST at work.
>If you fall into
>this category, please let me know who you are, your general field, and
>the type of institution you're at; I will compile this and post it
>(eventually!!).

I work at the Brown University Planetary Geology group, and we are
a heavy Atari shop. For our main processing we use VAX clusters and
workstations, but for word processing, small off-line tasks, and
TekTronix emulations we rely on about 10-15 Atari STs in various
configurations. (520s, 1040s, Mega 4s ... combos of color and mono).
We are also seriously looking into the ATW.

For communicating with the professors (Brown is Mac-happy) we
use Magic Sac and Spectre without problems.

Our lab does mostly image processing, mapping, mission planning,
graphics and numerical analysis.

>Are you able, through your institution's purchasing
>system, to purchase ATARI or are you, like me (at the University of Kansas)
>limited by State contract procedures (to MAC and Zenith)?
>

Well, we can only buy Macs and IBMs through the University computer
store, but a local Atari retailer gives us a university discount,
so we deal thru them directly. (Our grad students are now purchasing
Atari's for themselves...they can get the equivalent of a Mac SE
with a hard drive for about 1/2 the price of a plain SE.)
I suspect we spent about $8-$10K on Atari products last year alone.

Announcing the Atari Users Association. The A.U.A. is a group of
Atari users and dealers trying to unite Atari users and user
groups across the nation and around the world. Membership is
completely free and puts you under no obligation of any kind.
The goal of the A.U.A. is not to break up existing users groups,
or interfere in their affairs in any way, but rather to form
a network of users and users groups in order to promote the
more rapid spread of Atari-oriented information. This network
will provide a good base of very knowledgeable users
whom you can call upon should you need their help, as well as
being a good base from which to launch write-in campaigns to
software and hardware companies. For more information,
please contact....

Sorry to keep this thing dragging on.....

but if someone knows the answer to this, i can refrain from
future postings.....

I bought a quantum 80S from a Mac dealer... the "bare" drives
they get from Quantum are apparently already set up to run on the
mac.... ie., there was a jumper on one set of pins and the drive
seemed to be formatted for a mac already.... leaving the jumper
where it was , i couldn't get Supra to format the drive. I have
the latest version of the software which recognized the drive...
so i know it is not the software. Putting the jumper on other
sets of the pins either kept the drive from even spinning or
failed to allow formatting. Removing the jumper also failed
to allow formatting. As i have no idea what the jumper
configuration should be, i am hoping that someone who is actually
using the Quantum 80S with Supra Host could fill me in on the
pin configuration. Below is a diagram of the pins and the jumper
set when i received the drive in the mail. (my Atari dealer has
never worked with this drive before.... so he is at a loss as much
as i am....)

A0 . .

696. Still have a few 240 meg drives for sale!

Newsgroup: comp.sys.atari.st
Date: 1989-04-16 00:20:01 UTC
From: billsey@agora.UUCP
Message-ID: <1454@agora.UUCP>
Source record: 249270
Cross-posted to: comp.sys.amiga,comp.sys.atari.st,comp.sys.ibm.pc,comp.sys.mac,misc.forsale

I still have a few of the Maxtor XT-3280S drives for sale. I case you missed
the last posting, they are full height 5.25 inch SCSI drives. They format (on
an Amiga) to 244 megs (1000K megs... :-} 232 1024K megs). They are unused
drive, but are no longer in warranty. They were sold to a large data management
company, who never actually installed them in perminant systems. (The company
has now gone to 760 meg drives, that's why these are available...)
Here are the pertinant specs:

Drive type: Maxtor XT-3280S
of cyls: 1224
of surf: 15
sectors/track: 26 (512 byte optionally 256, 1024 or 2048 bytes)
average seek: 30ms
data trans: 1.5MB/sec burst, 900K/sec sustained
Power cons: 12V 4.5A, 5V 1.75A startup
12V 1.5A, 5V 1.75A sustained
Price: $1000 each, I'll include shipping inside the continental US.

If you have more questions, drop me a line or call... If you want to
buy one (or more...) send a check or money order (please, no cash) to:

Bill Seymour

There exist apparently differing versions of punct.mf. Our local version which was obtained from the sources not long ago, does not contain the offending variable "body_depth#". Instead, in all places where your version says "body_depth#", ours says "paren_depth#".
My advice therefore: replace "body_depth#" everywhere by "paren_depth#" and see what happens.

Can anyone else explain what is going on?

--Martin Costabel

699. Re: Replace those key caps. PLEASE!!!

Newsgroup: comp.sys.atari.st
Date: 1989-04-16 04:27:09 UTC
From: mfolivo@sactoh0.UUCP
Message-ID: <866@sactoh0.UUCP>
Source record: 249273

Key caps too big? No. Fingers to clumsy, maybe. What does he want, smaller keys? The size of the key do not present a problem to most people. And the rhomboid funcion keys? KEEP 'EM! The slant design looks better than the rest of the zillion keyboards out there, and the ergonomics of a rhomboid (as he calls it) has never presented a problem for me. If anything, maybe a new keyboard could include 12 function keys, so that running the ST under IBM emulation, we have all 12 function keys. And maybe an equivalent to a PgUp and PgDn, and an END key.

700. VIP file formats

Newsgroup: comp.sys.atari.st
Date: 1989-04-16 07:09:32 UTC
From: george_seto@brains.UUCP
Message-ID: <4427@brains.UUCP>
Source record: 249274

VIP file formats:
Does anyone know of a conversion utility that will convert the old VIP format .NAT file to the .WKS file format? A friend has a disk of Templates from the company that produces the EZ-Calc Spreadsheet and they have only two types of files, .EZC and the .NAT. The documentation implies that the .NAT is standard VIP format and can be used on any type of Spreadsheet. Now the only "universal" file format I know of is the Lotus WKS format. Thanks in advance.

701. Lisp for sale!

Newsgroup: comp.sys.atari.st
Date: 1989-04-16 16:38:26 UTC
From: 870646c@aucs.UUCP
Message-ID: <1814@aucs.UUCP>
Source record: 249275
Cross-posted to: comp.sys.atari.st,misc.forsale

I have a new copy of Cambridge Lisp for the ST for sale(the warranty card is still bound in the manual). I would like to get $50.00 CDN for it if possible. I will work on a 520 ST with a singe sided drive if it has to. This version of lisp supports all of the nice GEM things like windows, mouse, and other graphics things.

If interested you can reply to this message or call me at 1-902-542-9909 until April 22 and at 1-902-466-5345 after that date. By the way you pay shipping.

Later
Barry Comer 870646c@aucs.UUCP

P.S. I also have the follow for sale(in CDN funds, to get US price multiply by .8)

1-Assempro $40.00
1-Flight SimulatorII - $30.00
1-Scenery disk for above(#7) - $15.00
1-Scenery disk for above(#11) - $15.00
1-520ST and single sided drive(plus cable to hook up a Comm. 1084) - $300.00
1-Aegis Animator(updated) - $30.00
1-Flash 1.6 Terminal Program - $10.00

If interested let me know, and again you pay shipping.

703. WordPerfect SHELL command

Newsgroup: comp.sys.atari.st
Date: 1989-04-16 22:39:00 UTC
From: TK0GRM1@NIU.BITNET
Message-ID: <8904170052.AA11391@ucbvax.Berkeley.EDU>
Source record: 249277

A recent message (forgive me for not including it in this
one) commented that WordPerfect for the ST did not allow
execution of other programs while still in WP. This is true.
However there is a little know feature that can be used.
A past issue of STart magazine (at least a year ago) had a
CLI accessory written by Jeff Wilson. (Jeff is/was the main
author of WP/ST) If you stick this .ACC on your WP boot disk,
and RENAME it to SHELL.ACC, you can access it within WP by
hitting ^F1. Once inside the CLI you can execute some programs.
Not all of 'em of course..there are some limits with size and
environment.
Additionally, any desk acc renames as SHELL.ACC can be called
using the WP shell command...but be carefull as WP assumes some
things have been done when control returns....if your desk acc
doesn't do these things you may have some problems.

On other WP news. I saw the beta of the new version at Comdex.
The ability to use the fsel from the F10 selections is nice.
Hope we see it soon! WordPerfect was demo-ing WP/ST in the Atari
booth...but nary a sign of it over at the WP Corp area. But before
you get too excited I should add that the Apple II and Amiga version
were absent from the WP Corp area too. Seems they only wanted to
admit to the IBM and Mac support.

>limits on the files then someone could spend forever downloading and tie the
>system up for quite a while. If a person is given enough time they should be
>able to get through all the messages and still have time left unless your
>talkling about large message bases..

Yes, but why lump it together into one time limit? The way that STadel
does it just puts a limit on downloading - you won't be penalised if you
download some files first and then decide to read the messages. A general
time limit is, well, icky - I only know of 2-3 cases where a time-limit
would save the system from being hogged.

>And about the linear user limits.. I used the invitation onlly rooms for a
>while except that it did not allow me to easily add someone to a bunch of
>message bases.

Floors. Dump all the rooms into a floor and do a floor invite. About as
quick as bringing up a user-configuration menu and diddling access level
(though I can see that diddling access levels is marginally more intuitive
for most sysops - maybe 3.4...)

>I switched to FoReM cause it had all the power I needed although I miss some
>of the features of citadel...

Hmmm. But what about the users? Both of the major TC variants of citadel
haven't spent much effort on the sysop interface because both Hue (Citadel-86)
and I prefer to hack the user interface. Having a clean sysop interface at
the expense of a messy/awkward user interface is, umm, odd thinking for a
BBS system.

706. Re CLock chip

Newsgroup: comp.sys.atari.st
Date: 1989-04-17 06:15:13 UTC
From: george_seto@brains.UUCP
Message-ID: <4433@brains.UUCP>
Source record: 249280

Re CLock chip:

Derrick Williams @ritcsh.UUCP wrote about the installation of a Dallas DS1216E and I thought I should update you on this.

The Software as supplied from ST-Xpress is called Areal. I forget which version that is, but the sources were available with it. Over 6 months ago I found a newer version 3.3 usually seen as AREAL33.ARC on bulletin boards. It doesn't include the sources. The program was written by Bill Penner from somewhere in the Pacific NorthWest.
The Dallas Chip is easily added to the 1040 and 520 systems. You can even add it to the Mega Systems as well. The software will allow you to put the SmartWatch as it is called in ANY ROM socket available to the ST, any that would normally hold a ROM. You cannot put it into an unpopulated socket in the 2 ROM systems. As a matter of fact you can have as many SmartWatches installed as you have sockets. The sockets include the sockets in the Cartridge. The 3.3 takes care of a minor bug in the software which was included in the ST-Xpress version.

I put it into my system 3 months ago and have had absolutely no problems with it. It took roughly 10 to 15 minutes. The most of that time was used to take the system apart and put it back together again. All in all the actual installation of the SmartWatch took 3 minutes. This software is excellent. Much to be recommended. If anyone wants to get the software contact me through our Users Group here. Our disk librarian has it available on a disk for $5.00 Cdn. We supply the disk and other items of interest as well on the disk.

708. dcformat problems with drive B

Newsgroup: comp.sys.atari.st
Date: 1989-04-17 12:28:00 UTC
From: TOXI_CE@HNYKUN51.BITNET
Message-ID: <8904181140.AA02738@ucbvax.Berkeley.EDU>
Source record: 249282

Distribution-File:
"info-atari16@score.stanford.edu"

I tracked down part of the problem with DCFORMAT.
Both DCFORMAT vs 2 and 3 have problems formatting on drive B.
After the whole disk has been formatted, there is an
access to drive A. (Probably to move the head back to track 0
or something). With DCFORMAT 2 the resulting disk has 0 bytes free,
with DCFORMAT 3 I don't remember. But the verify often does not
work.
I hope that somebody from Double Click can comment on this.

Finally! ZOO is out on comp.binaries.atari.st.

I just downloaded it and at once tried to packed the PD Modula-2 system into a ZOO file. It works very fast. Storing the complete Modula-2 system (about 550k) from floppy to a ZOO file on harddisk took nearly 8 minutes.

Thanks to Daan Jitta for the port and especially for the additional "/" option which allows to add a complete file systems to an archive without having to mention each and every file explicitly.

As I already announced before I mailed the Modula-2 system to Steven Grimm. It should show up on comp.binaries.atari.st within the next time.

```
Have you though about inverse folding? For highly indented
code it would be good to just look at a single block, ignoring
preceding levels of indentation.
I.e.

x()
{
while (1) {
if (blah) {
if (foo) {
if (bar) {
/* code */
}
}
....

becomes

MARKER
if (foo) {
if (bar) {
/* code */
}
}
MARKER

Date: 1989-04-17 16:50:53 UTC
From: a360ad@blake.acs.washington.edu
Message-ID: <1610@blake.acs.washington.edu>
Source record: 249292

Thanks to all the netters who have been helping with my
drive fiascoes.

The problem i had with getting the Quantum 80S running was in
the Supra Software. My dealer had version 3.30... I called
SUpra this morning and was told that 3.30 has a bug in it that
prevents the Quantum 80S from formatting. I need version 3.34...
A fellow netter had told me this yesterday as well.

SInce i do not have an account on Genie... Mark at Supra said he
would mail me the update. If anyone can uuencode 3.34 and mail it
to me today before 2PM Pacific time... i would very much appreciate
it... otherwise, i will have to wait several days for the mail...
and then have to wait a few more days before i can get down to my dealer's
and pick up the case and power supply etc....

thanks!

719. The Terminator Atari Archive

Newsgroup: comp.sys.atari.st
Date: 1989-04-17 18:24:11 UTC
From: dyer@math.lsa.umich.edu
Message-ID: <619@stag.math.lsa.umich.edu>
Source record: 249293

Well, after 8 months on the U of M mainframe, the PC7 archive is moving again. This time we're moving to a Sun that's managed by our Computing Center. This provides the following advantages over the current system.

1st Access is no longer based on the whim of the HIM. It should be accessible with many fewer complications now.

2nd I've set up the new archive to take advantage of the Sun's hierarchical file system. Now things will be placed in categorical directories.

3rd We can get a mail server going now. MTS had messed up translation tables, so uuencoded files got trashed in the mail.

4th People can submit files to us via ftp again.

5th MTS used a strange form of ftp. Things should work normally now. (* for wildcard, dir gives useful output...)

Here's a brief rundown on how to get a hold of the new archive. (him1 will still be available, if you're into masochism)

to get to the archive:
% ftp terminator.cc.umich.edu
or
% ftp 35.1.33.8

to get to our files:
ftp> cd ~atari

Ask your local ftp-god about how to transfer stuff, or wait until I release a revised version of my (in)famous FTP cookbook.

The index will be put together in May, *after* f*nals.

FTP submissions should to into ~atari/new

Mail submissions should be sent to:
dyer@math.lsa.umich.edu

Jon Brode -- dyer@math.lsa.umich.edu usercptb@umichub.BITNET

>the window. The MWC tools already* provide a flag ("unreasonable"
>command line length byte) which can be used to validate the ARGV, and it
>is unused by the MWC startup code!
>

Ken, it sure looks like you want to attack MWC here. If the method is
"standard", "good" programs won't mess with the environment in "bad" ways.

I think something that Allan Pratt (sp?) suggestted a long time ago where
the parent places a variable like "PARENT=" or simething which contains the
parents basepage address is a reasonable additional method of validation
of the ARGV environment. Also the MWC startup could be modified to use
the "unreasonable" command line length byte and Roger's suggestion of
nulling out the env. at the ARGV is also good.

>| --
>| Programs which ignore the ARGV convention for arguments end up
>| mis-interpreting ARGV specified arguments as environmental variables

>|
>| This problem is addressed differently by the ARGS and xArgs proposals.
>|
>[means of addressing the problem omitted]
>
>Hah, I caught you! You admit that ARGV is imperfect! ;-) You are even
>willing to change the startup code to make it more perfect!

I think that's *exactly* what Roger was saying. What's wrong with that?
Are you suggesting the xArgs and/or your method are perfect? They all
have problems. I think any method using the environment for something
other than it is intended for is never going to be perfect. Sorry. GEMDOS
should just do it right. That's the only "perfect" answer. I think what
Roger is saying is that with some minor improvements the ARGV method is OK.

>
>| [Roger discusses solutions for programs which mess up the env.]
>That's very nice, but the other two methods of extended argument passing

>don't require ANYBODY to be insulated from them. In fact, all THREE
>methods can peacefully coexist in one system, except that ARGV will
>cause problems for programs which haven't been "innoculated" against it.

Say what? Are you saying that I won't have to upgrade any of my 500 or
so utilities? None of my 25,000 customers will need upgrades with the new
Atari standard? Not including the countless non-commercial home-grown
utilites that use MWC ARGV arguments? You see all approaches are going
to require lot's of binary patch programs and upgrades. Whether it's
for "innoculation" or "fixes" I don't really see the difference and neither
will the users.

I think you're forgeting how many *commercial* programs use the ARGV
"standard". This will play a big role in the standardization phase.

>
>| If Atari wants MWC to discard the ARGV argument convention, I hope
>| they'll wait until they can find something better to replace it with. :-)
>|
>| -- rec --
>
>If MWC wants Atari to adopt the ARGV argument convention, I hope they'll
>come up with some better defenses for it. >;-)

This is the most important and strongest statement that Roger makes and you
simply discount it. I don't think that either your method or xArgs are
really better than ARGV in all respects; they're just different.
Each method has advantages and disadvantages. What I'm is saying

WHY CHANGE IT JUST TO CHANGE IT?

Wait it out; let's get this thing fixed right instead of just introducing
a bunch of new problems for developers and end-users alike. Do we have
a solution looking for a problem or what? :-)

>
> GFA Basic is a commercial product and should not be distributed (or
> solicited) freely.

In what I consider A Smart Move, the GFA people placed their "run-only"
interpreter in the public domain. That way someone can buy the
whole package, write a program, and distribute the program plus
the run-only interpreter so others who don't own GFA Basic can run it.

Moreover, they actually ENCOURAGE the widest-possible distribution for
the run-only interpreter. It's on GEnie, CI$, etc., and of course GFA
BASIC programs appear in those places, too.

I think this was a stroke of genius on their part: it has the advantages
of distributing a crippled "demo mode" program with none of the
disadvantages (both practical and political), and it lets people write &
distribute GFA programs without narrowing THEIR potential audience to
GFA Basic owners.

723. Atari TT graphics

Newsgroup: comp.sys.atari.st
Date: 1989-04-17 19:46:46 UTC
From: pa1132@sdcc15.ucsd.edu
Message-ID: <1413@sdcc15.ucsd.edu>
Source record: 249297

According to the newest issue of "ST Report", the graphic
resolution of the Atari TT will be 1280x960 mono, 640x400 16 colors,
and
320x200 256 colors. Is this info accurate? If this is true, then
how can the TT have a future, when the Amiga 500 , at about $700,
have about the same graphic power (as far as the color resolution
is concerned)? Atari, you really make Atari users disappointing
over and over again.

725. Bunches

Newsgroup: comp.sys.atari.st
Date: 1989-04-17 21:15:32 UTC
From: JJL101@PSUVM.BITNET
Message-ID: <89107.171532JJL101@PSUVM>
Source record: 249299

Hmmm... first off , does anyone know where I might be able to find
any backissues of STReport and ST Zmag on line through an FTP somewhere?
About the HIM1 ftp site, I have noticed considerable slowdown in
transfer times lately, and sometimes it just times out on me... any ideas...
tranfers are averaging about .3 Kbytes per second, used to be about 9 for me.
Also I know they have been floating around, but anyone have a current
list of FTP sites containing ST software? Thanks in advance.

Taz

726. Back issues of this newsgroup?

Date: 1989-04-17 21:33:41 UTC
From: JJL101@PSUVM.BITNET
Message-ID: <89107.173342JJL101@PSUVM>
Source record: 249300

Are back issues of this newsgroup stored unarchived somewhere - I know they are at HIM1 ftp but they are arced, and this IBM will not properly dearch these files as it says they are done with an obsolete method.

Any other places to get them?

Taz

727. Re: Calamus. It's GOOD, but how do I prove it?

Newsgroup: comp.sys.atari.st
Date: 1989-04-17 22:19:35 UTC
From: Dave_Ninjajr_Flory@cup.portal.com
Message-ID: <17331@cup.portal.com>
Source record: 249101

The latest (May 1989) issue of START has a review of Calamus which pretty
well reflects my experience with it, i.e. its close to if not the best.
Calamus Plus, with fixes for the few bugs and graphics rotation added,
along with some other things will be the best DTP program available. Add
to the package the fact that ISD is selling a direct Linotronic interface
which takes the place of the approx. $20 raster image processor, and you have
a package that a lot of printshops are investigating with interest.

730. Spectrum Holobyte & Falcon

Newsgroup: comp.sys.atari.st
Date: 1989-04-18 01:26:08 UTC
From: Xorg@cup.portal.com
Message-ID: <17339@cup.portal.com>
Source record: 249104

THE Mr. Gilman Louie's failure to accept the fact that his
ISSUE: original comments on the ST piracy were based on

nothing but RUMOR and MYTH. (The comment being that
the ST community is more tolerant of piracy than their
MS-DOS or MAC counterparts.)

THE A letter which I uploaded about a weeks ago. In this
REBUTTAL: letter I used very basic concepts to point out that in
order for Mr. Louie to properly and realistically address
the effects of piracy on any machine, he must address the
factor of MARKET SIZE in addition to the number of units
sold per machine.

THE Mr. Louie's ORIGINAL UNALTERED 'open letter' which has
EVIDENCE now appeared on all the major services and in every
EXHIBIT A: ST and most *non-ST* magazines. This letter is printed
in its original UN-ALTERED form in the April issue of
Current Notes and many other magazines.

EXHIBIT B: Mr. Louie's * ALTERED * 'open letter' in the current
issue of Atari Explorer (May/June) in which the
original letter appears with the * DELETION * of the
paragraph in which Mr. Louie stated the number of sales
to be expected for a "good-selling" program on each
type of machine. These figures were used as a basis
for my rebuttal.

This paragraph:

"When MacIntosh and IBM versions were released, they
sold four times the volume of product over the same
period of time. Based on the current sales trends,
the ST developer will be lucky to break even. A good-
selling Amiga or MacIntosh product will sell 20,000-
40,000 copies in its first year. And IBM title will
sell 40,000-100,000 copies, yet a top selling ST
program would be lucky to sell more than 15,000."

Has been carefully and curiously EDITED OUT of the
original text of the 'open letter'.

THE BIG
QUESTION: >>> WHY?? <<<

Sales of ST FALCON have soared since the advent of advertising in ST
magazines and the reviews currently being printed in the ST press. In a

4-6 week period over 7,000 copies of ST FALCON have been sold making it the best selling ST game program both in the United States and Europe. I and many other ST owners defended our machine and predicted that ST FALCON would be the number one best selling program and that ST FALCON would reach the 12,000 sales needed for it to break-even with ease once advertising and reviews used the ST user base.

I expected that Mr. Louie would accept the facts and events as they have unfolded in the past two months. I expected that he would take the opportunity to show his company's self-proclaimed dedication and support of the ST to post a retraction, correction, or update of his previous comments about ST users, especially in light of the fact that his letter has appeared in non-ST magazines, further damaging the reputation which and many many ST owners have been fighting to uphold for years.

I leave you with the evidence above to draw your own conclusions.

Peter Szymonik

731. list of ftp sites

732. TurboDOS?/Monochrome Font?

Newsgroup: comp.sys.atari.st
Date: 1989-04-18 04:02:25 UTC
From: lean@sbcs.sunysb.edu
Message-ID: <2596@sbcs.sunysb.edu>
Source record: 249106

Does anyone know what the latest version of TurboDOS is?
It's been out for more than a year, and i imagine there must have
been a newer version. I've used TurboDOS ever since it came out
and i just love it (Fatspeed, Nullfill, what-have-you don't come
close to TurboDOS as far as the speedup is concerned).

Is there any chance that Atari will use a different system
font in the newer ROMS? The nice.fed font file (with the monochrome
fontloader program) that Steve posted a while ago looks REALLY nice
and professional, and i hope Atari will consider using it in the ROMS.
At least then, the ST will look like a real machine. :-) Also has
anyone managed to get TurboST to use the new fonts (nice.fed, etc.)
instead of reverting back to the fat and uncultured system font.

I think he wants smaller keys. The ST keys are about 2 mm wider than
most typewriter's and even wider than most terminal keys. The rhomboid
F-keys usually present a problem to new users. The answer is to aim for
the numbers on the keys, not the centers.

I'm not the greatest typist in the world, but my errors increase significantly
when I touch type on the ST. The most common error is hitting 2 adjacent
keys because the caps are too large. I know this must be the case because
I don't make nearly as many errors on typewriters and other computers (with
selectric keyboards). Smaller caps are in order (as well a mega style key
response, which I've fallen in love with).

I would appreciate slightly smaller key tops, but find the distance
between centers to be just about right. I would like pimples on two
keys, the "F" and "J" keys, to tell my index fingers when they are
in the correct position. I have no interest in more spring tension
under the keys.

Function keys grouped in a rectangle would be more ergonomic than
having them spread out in a long line. Just having a break
between groups groups of keys would be some help. As it is,
I tie my most frequently used key functions to keys near the
end of the line, and hate it when I have to look down to find
"F5" or "F6" in the middle of the line.

FLAME ON...

Now, I'm usually the last person to defend Atari, but this is getting a bit much. The 'authour' of this article wasn't sure of the information (by his own admission) he provided. But that evidently didn't stop him from expressing his "sorrow" over Atari's choice of capabilities for the TT.

Now, I don't know what capabilities the TT will have once introduced. Perhaps it will feature the resolutions described above, perhaps it will not. Until we're certain of the facts, we should refrain from the sort of comments made in the above article.

...FLAME OFF

BTW, I would be quite happy with 1280x960 mono (if the monitor is larger than 13'' :-) If the graphics are done off-cpu (ie. the 68020, if that is what the TT will have, doesn't have to do all the work) and at reasonable speed (for X-type work) I would be ecstatic.

739. DeskJet paper

Newsgroup: comp.sys.atari.st
Date: 1989-04-18 14:01:18 UTC
From: bane@mimsy.UUCP
Message-ID: <16975@mimsy.UUCP>
Source record: 249113

As there's been a lot of interest in the DeskJet lately, I thought I'd put in my two cents worth. If your DeskJet doesn't print "almost as good as a laser printer," try changing your paper. DeskJets print badly on super high-quality laser-printer paper; that paper tends to be a little "furry" because of the rag content. This is great for making dry toner stick, but it makes DeskJet ink bleed because the ink is water-based.

My local office-supply shop was kind enough to give me two sheets of each kind of paper they sold in case-lots; on taking it home and printing a DeskJet test sheet on each, I discovered that it actually looke the best on mimeograph paper, which costs about half as much as laser paper. The mimeo paper didn't appear to have a "best side" either, a phenomenon common to laser-printer paper.

> nulling out the env. at the ARGV is also good.

I think Ken misses something more: The parent doesn't have to copy
anything. When Pexec starts a program the loader copies the environment
string, so the user may hack it up as much as he wants it without
affecting the environment of the parent.

The MWC method (including writing a \0 over the ARGV if you want to
incapacitate an ARGV) works well already for ages by giving validation
via PBP=parentbasepageaddress in front of ARGV. You may also have the
startup code write the \0 over the PBP which is better.

The major shells use something like it (or part of it), MWC uses it,
Aztec uses it (they use Gulam). Only Turbo C didn't use any but the
startup code is fixed quickly. Laser C is the one that opted to either
not understand the convention or go deliberately their own way. So what,
it isn't a good compiler anyway (the code is 30% slower than turbo and
the best debugger is the one of MW).

First Atari doesn't give us decent documentation, and then when a
standard is emerging they are going to criticize it and talk about
fantastic schemes that 1: aren't better and b: NOBODY is using.

Keep it up guys!

A friend of mine has both an 800XL and a 520ST, and while he can connect both to a TV, he'd much rather use a monitor. He was wondering if a monitor existed that handled both the composite signals from the XL and the RGB and/or monochrome signals from the ST. Please send replies to me and I will summarize if enough interest is generated.

>Sounds real nice. How about making some use of more than one
>special screen attribute? Like inverted *and* underlined *and* ...
>For instance, indexed words might appear underlined.

Folded actually has the routines in it to do so, since my prototype
was on the Atari ST and used colors as well as reverse video. When I
moved it to Unix, however, I found that some terminals (like my Wyse
50) don't handle underlining/standout very well. Some terminals use
an extra character position on the screen just to show that you are
entering or exiting reverse video or underlining, so it gets messy if
you wanted a line to contain both...it is bad enough dealing with just
reverse video. I do plan on looking into this problem, though.

What are indexed words? Key words, maybe?

>Can you have null folds, in case you just want a line to stand out?

No, I decided that would be too confusing from a human interface point
of view...you want to train your eyes to think that a highlighted line
represents a hidden block of text. Always, not just sometimes. On the
other hand, if you had colors...

NOTE: Several people have asked about a ship date for folded...I
should mention that up until yesterday morning I was planning to
release the first version at the end of April. Unfortunately,
CDC shut down ETA yesterday, so I am suddenly unemployed.
What this means is that I won't be able to do any real-time
testing on Suns, Apollos, or SysVR3. It also means I will be
busy job-hunting, so either the release will slip or I will
post it with some 'extra' checking built into the code.

While horizontal scrolling is a very good idea for terminals used in writing code (especially when compilers allow long lines of 512 characters or more) it would seem less useful when writing documentation or other text primarily oriented toward human readability especially when the output will be sent to a printer of some sort that probably will not support horizontal scrolling.

Could there not be a configurable/toggled wrap margin so that word wrap could be enabled when useful and disabled when horizontal scrolling is the best way to go? Being able to set what column is the wrap margin (ala' vi) would also be very helpful.

I'm looking forward to seeing FOLDED soon and will port it to a couple of HP 9000's (300 & 800) ASAP!

>so utilities?

If they know about the commandline in the basepage, why should they need
upgrades?

> ... None of my 25,000 customers will need upgrades with the new
>Atari standard?...

It cuts both ways. Those of us who use the other ways to pass arguments
around may end up having to modify our code to work properly with the
new standard, whatever it may be.

> ... You see all approaches are going
>to require lot's of binary patch programs and upgrades. ...

Why? I've got programs that don't use xArgs and they coexist just fine
with xArgs. I cannot imagine that the MWC `standard' works out any
differently, except for the magical appearance of garbage in the
environments of the (non-conformant) child processes.

>I think you're forgeting how many *commercial* programs use the ARGV
>"standard". This will play a big role in the standardization phase.

And you may be forgetting how many shareware programs use xArgs.
Considering that dlibs and Sozobon C both use xArgs, the percentage
of programs using that `standard' will grow.

Your comment that real argc/argv should be a extention to Pexec() is
correct, and I agree that it's what Atari should be doing. But saying
that the MWC style should be the second choice because it's `there' is
like saying "we can't fix Malloc() because people take advantage of
the broken code."

At risk of sounding like a broken record, I'll note again that one of
the reasons that Dalnefre', John Stanley and I made up the xArgs method
is that we (well, *I* - I dunno about Dale and/or John) didn't think that
the MWC method was worth it's weight in fetid dingos kidneys. Cluttering
up the environment with untracable arguments and iovector `stuff' is
about as unaesthetic as you can get.

> corrupted spreadsheet or database before you find out about your
> memory. Does the Mac have parity? I would think anyone using their
> computer for accounting/bidding etc would insist upon parity.

Maybe, maybe not. IBMs and true clones have parity ram, most other personal computers and similar machines (Mac, Ataris, Amigas, and even NeXTs) don't. When, if ever (physics says it can happen) a bit gets blasted by cosmic rays on a non-parity checking machine, you don't notice it unless it's in a piece of code, at which point you have a good chance of crashing. But if it's in data, you probably end up saving the bogus data. A PClone just plain crashes when it detects a parity error, with a nice message on the screen telling you why you just lost the past 10 hours or so of spreadsheet work (well, really, no one does any REAL work on these things, do they). Parity detection lets you know an error occurred, but you can't do anything about it. And you present a target that's 9/8ths larger, so you have a 9/8ths greater chance per unit memory of having a zapped bit. Some workstations implement error correcting memory, which is a definite advantage all around, unless you're paying for it.

I appreciate John's information about the clocks, but I remain a bit confused about what is happening. The Paul Close program that his wife posted gives me separate readings for three clocks when I boot with the Supra clock-reading program: the TOS clock, set with a gemdos call, is correct, supposedly set by the Supra program. The BIOS clock reads 1 Jan. 2048, which is what Word Perfect comes up with. The supposed keyboard clock reads 1 Jan. 1900! When I run a program to set all of the clocks which reads the TOS clock with a gemdos call and sets the BIOS clock with xbios(22/23) (I forget which it is at the moment), all three clocks report the same time. So what is Kgettime() reporting? Or is this related to the bug that John reports?

I also am dissapointed at the keyboard of the ST. It just feels too
unresponsive. I've tried putting MegaTouch springs in the keyboard, and while
it's a bit stiffer, it becomes less responsive. Is there any way to get around
the "rubber cup" smooshiness characteristic of the st?
I would really enjoy my st more if the keyboard followed traditional styles
like the Atari 800 (REAL contacts, none of the rubber cup business). I would
be willing to pay more for an ST with a decent keyboard, but I'm stuck
with the one I have.
Chris Freemesser has suggested placing a spacer (cut out of sheet rubber)
between the plastic cyliner of the keys and the rubber cups to decrease
the throw distance. I havn't tried this, but does anyone have any mods or
heard of mods to improve the tactile feel of the ST?
Where I'm living now, there are many keyboards from old terminals available,
but I suppose it won't be possible to replace the ST keyboard with it.

Thanks,

Derrick

An artsie and an Engineer once sat, 'twix them a gallon can;
Said the artsie, "Match me drink for drink, let's see who's the better man."
They drank three quaffs, the artsie collapsed with a face turning green,
But the Engineer drank on and with a sneer said, "It's only gasoline!"

>here? If it is fixed, please send me a copy or a pointer.

In the uw server 4.2 that I am using, one is supposed
to compile with the -DUTMP option so that uw can update /etc/utmp.
However, this doesn't seem to work. Sorry to say, I have not
had the strong desire to track this bug down (don't we all have nicer
things to do?).

I get around this by typing
% rlogin localhost
when I really need to talk to someone. Sometimes it's an advantage not
to be seen by people... y'get more work done. :-)

762. DVI drivers and an Xmodem question

Newsgroup: comp.sys.atari.st
Date: 1989-04-20 04:08:10 UTC
From: jparker@watvlsi.waterloo.edu
Message-ID: <4309@watvlsi.waterloo.edu>
Source record: 249136

I have a couple of questions which are really not related but which I would appreciate some answers to:

1) Some months ago, I asked if anyone had ported TeX dvi drivers for the HP Laserjet or Laserjet Plus...I was told basically no, but that it shouldn't be that difficult. Before I give it a try, I thought I would check again if it has been done, or failing in that, could someone tell me what changes need to be made to port the generic drivers (DVIJET and DVIJEP) from the TeX archive at science.utah? I assume whoever ported DVIEPS used this as a beginning and could tell me what is required.

2) I usually use Uniterm2.0e and Xmodem/Ymodem batch for file transfer and it works well. However, whenever I transfer text files, I end up with a line of ^Z^Z^Z^Z's at the end of the file. I think I was told once that this is a problem with Xmodem (not with Uniterm). Is this true...and if so, is there anything that can be done to get around it?

I'm sure I had more to ask, but for now this will do.
Thanks for any responses.

>it runs out of memory on certain attempts.

Hi,

well, to answer your question, I'm perfectly satisfied with zoo. I've used commands like zoo l <archive>, zoo e// <archive> and zoo aM <archive> *.* without any problems.

As to memory, I haven't tried everything yet but the applications I used never ran out of memory on my Mega 2 with a 800 K Ram Disk and about 1.1 M free Ram. Maybe you could give an example of an application that runs out of memory and tell us how much free ram ther was left before you started zoo.

Oh, and while I'm at it, the ST zoo unpacks Unix zoo archives without any problems.

Martin

I think I was bitten by this on my system with a 60MB Supra disk with
built in clock. I would set the clock using the supplied SUPCLKRD and
then find that it seemed to have stuck. I checked it against all my
other startup programs and desk accessories and eventually discovered
that the problem only occurred with ROCP.ACC, the (extremely useful)
read only control panel accessory. With great regret I had to stop
using it. I've no idea if a fix is possible but if the author of ROCP
is listening ... :-)

If I were doing this on a PC, I would install GEM for a
Postscript printer and then send the printer output to a file.
And that should do it.

I don't have GemDraw for the ST, so I don't know if it can drive
Postscript printers. If it can, you should be able to do the same
thing. If it doesn't have the facility to print to a file maybe
you could use Moshe Braner's Barrel utility to catch the printer
output.

Hope this helps.

766. REpost of pins

Newsgroup: comp.sys.atari.st
Date: 1989-04-20 12:41:33 UTC
From: 870646c@aucs.UUCP
Message-ID: <1838@aucs.UUCP>
Source record: 249140
Cross-posted to: comp.sys.atari.st,comp.sys.amiga

This is a reposting of the pin connections for hooking up a Commodore monitor to an Atari ST.

Well here is the pin connections for hooking up a Commodore 1084 monitor to the ST computers. First off you are doing this on your own and are taking all the risks(I guess that you need this type of header).

The cable that I used is from Practical Solutions, which is a nice cable all shielded and has the ST connector already hooked up. Also included is the pinouts and their corresponding coloured wire.

ST pins number Commodore 1084
6-GREEN-RGB 1
7-RED-RGB 4
9-H SYNC 2
10-BLUE-RGB 5
12-V SYNC 6
13-GROUND 3

That is all there is to it, remember to hook the shielding up to the outer shield of the 6-Pin Din plug on the monitor end. You can pick up the Din plug at Radio Shack for two bucks or so. It works for me, if you are not sure about doing this yourself GET SOMEONE ELSE TO DO IT FOR YOU!

later
Barry Comer 870646c@aucs.UUCP

P.S. Also remember that the ST should be plugged into the ANALOG(?) RGB port.

> is concerned)? Atari, you really make Atari users disappointing
> over and over again.

Uhh, the new Amiga chipset allows a 1280x800 resolution with 2 bitplanes
(4 colors). And I can do 640x400 16 color (4 bitplanes) now, with my standard
500, along with the standard 320x200/400 4096 color HAM mode - the one thing
Atari has advanced in is a 68030 computer - how far along is it?

Source record: 249142

Well if you want to preserve citadel's workings and just make two changes it
would work just fine under forem...
Since forem takes the modem off hook on all local logins it would be
unecessary for the citadel running under forem to play with it...
Hmm did I say two changes? anyways..
What forem will do is the following when it runs a door program.
It creates a file containing the users name and time information etc
(I think it would be best to ignore this for now though)
and then from its menu it will run the program just as the desktop would..
A programs entry in the menu looks like this..
Citadel
24
intro.txt
remote.prg
local.prg
exit.txt

The above line "Citadel" would be the menu name given to the user..
intro.txt would be printed while it was loading the program (exit.txt
is the exiting text)
the 24 is the user level that the person needs in order to run the program
the remote.prg would be the program taht would run if its a remote call and
local.prg would be run if it was a console login..
I think that if you let citadel accept a command line shutting off any sort
of line handling from citadel (Ie don't hang up the modem or even touch
the lines... Just check for carrier...) and had it look at the carrier detect
at the initial run of the program to see if its a local call or not and handle
the text outputting accordingly it would work great..
When I ran Citadel on the st it was when the floor stuff was initially added
and there was nothing like a floor invite at the time...
I had alot of people that liked citadel alot but at the time there were not
enough features in it.. So I went to forem.. I should be able to add citadel
real easy since the way citadel works is very simular to things forem allows..
Citadel will run easily under 512k I do assume..
(I hope you were able to pull out something out of this garbage.. I cvant seem
to type straight this morning..)

in article <6919@saturn.ucsc.edu>, roman@jupiter.ucsc.edu (Roman Baker) says:
> Keywords: 68000

> I heard from somebody that the 68000 uses 32 bit internal and 16 bit
> external. What is this supposed to mean. Does it used 32 bits for internal
> calculations or addressing but only have a 16 bit bus?

That's basically it. All registers are 32 bit wide, and so is the address space. Externally, the 68000 talks to the world on a 16 bit bus, and only 24 bits worth of address are brought off-chip. Internally, there are actually three 16 bit ALUs, two of which team up for 32 bit operations (which accounts for the longer time some 32 bit operations take, even when you're not fetching additional memory).

This has been a tremendous advantage for the 68000 family, since with the 32 bit programming model, you don't have to change correctly written 68000 code to run on any of the full 32 bit members of the 680x0 family.

From: 01659@AECLCR.BITNET
Message-ID: <1463@cfa.cfa.harvard.EDU>
Source record: 249146

If anyone has experience with digitizers for the ST would you please forward a mini review to me; our group is looking at buying a digitizer (not a hand held model though).

Does anyone have information of LCD displays to use with the ST? I am looking for the type of device that one plugs into a micro and it can display the monitor's image on an LCD display that is placed on an overhead projector so large groups can see what is going on with the micro. Can PC models be adapted for use (i.e. will a cable connector change suffice as is used to put EGA multisync monitors on STs)?

>Or is the 4 meg limit set in the hardware?

Software isn't everything.

The custom chips in my ST (520 Rev C) have 22 bit adres registers.
So DMA, MCU, Shifter can adress 4 Meg. Nothing more...

775. Re: WordPerfect & Bug in ST clock setting

Newsgroup: comp.sys.atari.st
Date: 1989-04-20 22:15:04 UTC
From: close@cacilj.UUCP
Message-ID: <975@cacilj.UUCP>
Source record: 249149

Much thanks to John Stanley and Dale Schumacher for correcting my misinformation about the ST's clocks. My sources were wrong, and there are, indeed, only two clocks. MWC refers to the ST's ``several clocks''. I don't consider 2 to be several... I was further confused because MWC has two routines that actually set the keyboard clock, but one appears (at first) to be documented as setting the bios clock. What that routine really does is set the keyboard clock via a different route.

James, the programmer for WordPerfect's Atari division, called me today and we figured out what was going on. WordPerfect reads *both* the gemdos and the keyboard clock and takes the *larger* date as the correct one. In earlier versions of the ST, an unset keyboard clock read 1900 or something smaller as the year. Now it reads 2028, 2048, or 2058 depending on what ``version'' ST you have.

As mentioned in earlier postings, many hard drive companies only set the gemdos clock with their clock-setting software. As long as Atari's control panel is present, this isn't a problem. Apparently the control panel automatically ``syncronizes'' both clocks (correct me if I'm wrong, but this is what it appears to do). But, with the control panel missing, the keyboard clock isn't set. Since it is the ``larger'' date, that's the date that WordPerfect uses.

So, this problem only shows up if you like to run with maximum desktop space and leave out the control panel (as I certainly like to do--the control panel is way too big). The fix is either run WordPerfect with the control panel present, or set both clocks.

WordPerfect (James) tells me that to fix this problem in WordPerfect would be very difficult. I don't necessarily see it as *their* problem anyway--the hard drive people should be more careful about which clocks get set, in my opinion. What WordPerfect is going to do, then, is inform people about this problem in a README file and include a proper clock-setting program for your auto folder. Sounds like a reasonable fix to me...

I find it soort of odd that people have trouble with the keyboard. I have had my Mega 4 since last summer, and I have found it no problem, after upgrading from my 800XL. At work I use a Panasonic keyboard, a NCR keyboard, and a DEC. At home I have a 1040 an 800 and a 800XL. Going between so many keyboards, I just adapt that each one is different, although the 1040 is at the bottom of the list, and Mega 4 and 800 have better keyboards (among the Ataris). Although I haven't measured it (does 2mm make that much of a difference?) the ST keyboard is very similar to the DEC keyboard. In fact, it was patterned after it. I am one of those fast "non-typist", I don't touch type, but I am pretty fast neverthe less.

> for use (i.e. will a cable connector change suffice as is used to put EGA
> multisync monitors on STs)?

I'm not sure if this will be much use to you, but a company in the UK is working on such a device for the ST. It's being done partly as a favour for one of my colleagues who knows an employee. They are adapting a PC display (imported from the USA, and which can display EGA) and at the moment they have an extra box that sits between it and the ST.

When they demoed it for us last month it worked fine in medium and low res, but they didn't know how to make the device send the signal to the ST that makes the ST think it has a mono monitor attached. We (not me personally) told them how to do that, and sent them away to finish it, with the promise of an order when it could work in all three resolutions.

As it's something of a custom job, it's not cheap. Prices aren't yet fixed, but it seems that by the time we add on taxes it will cost us around 2,000 UK pounds.

We'll know as soon as it's ready, and I'll post full details at that time. I'd be interested to know if there's any competition.

Graham.

Re my last message about System2....

I seem to be having some trouble replying to mail from outside the UK at the moment. I've now sent System2 to uk.ac.lancs.pdsoft, so it should be appearing on their library soon. The library can be accessed on-line by calling uk.ac.lancs.pdsoft through JANET, and using PDSOFT for both the username and password. Please be patient if you've sent mail & haven't got a reply yet!

Dave

785. TURBODOS, L-CACHE Observations

Newsgroup: comp.sys.atari.st
Date: 1989-04-21 19:05:09 UTC
From: andyc@hplsla.HP.COM
Message-ID: <5440023@hplsla.HP.COM>
Source record: 249159

Fellow Atarians:

I recently got set up with a hard disk on my Mega ST2 and have experimented with a couple of shareware programs, L-CACHE and TURBODOS. I'm puzzled by some of the results!

First, neither of these programs affects results obtained by the ICD RATE.HD program - I guess that this program operates at a low enough level that caches and VDI-speedups are bypassed, so that's not too puzzling. But it does mean I need another way to compare disk performance.

So, my method of assessing the performance improvements due to these programs is to move a group of 5 folders containing about 30 files of medium size from one segment of the hard disc to another. This is something I do fairly often and find to be irritatingly slow, even with the hard drive (about 30 seconds).

Given this benchmark, TURBODOS yields a solid 30% improvement over TOS. I would not expect L-CACHE to make any difference in this experiment, but it did - L-CACHE slows things down by 50 to 150%, depending on the size of the cache. (The larger the cache, slower things go). This doesn't make sense to me!

Further, in experiments where I expect L-CACHE to make a difference, it usually doesn't. No matter the size of cache that I define, only small files seem to get cache'd, the larger files never do. I find that most of my programs and data files are fairly large, and L-CACHE just seems to be a drag on the system.

Both TURBODOS and L-CACHE conflict with another shareware program I use occasionally - ST-TALK. If I try to run ST-TALK with either program loaded, I get 3 to 12 bombs and have to reboot. This sort of situation makes me pretty nervous, what with 65 MB of corruptable disk lying around. I've tried TURBODOS with alot of other programs and there doesn't seem be any other conflicts, my guess is that the problems are with ST-TALK.

Comments appreciated!

Cross-posted to: comp.sys.atari.st,comp.sys.ibm.pc,comp.graphics

Hi,
I'd like to thank all those who responded to my original posting
about help with the GIF file format. I had originally planned on thanking
everyone individually , but there are so many people that I don't think
I'd ever get to thank all of you. Also I'm sure I'd end up with some
bounced mail. I received many requests for similar information so I
have decided to post what I have recived. Sorry it took so long to get
to it, but I've been busy and responses have continued to come in until
a few days ago.

The orignal posting was sent to: comp.sys.atari.st, comp.graphics
and comp.sys.atari.st. I am going to send the five items I am posting
to comp.graphics ONLY.

There are three documents and two postings that contain C source
(these are uuencoded and zoo'd - that's the way I got them). I received
multiple copies of a couple of things, especially the Compuserve
document on GIF.

Thanks again to all who reponded and good luck.

791. MWC bugs

Newsgroup: comp.sys.atari.st
Date: 1989-04-21 22:28:16 UTC
From: foster@ihuxv.ATT.COM
Message-ID: <3329@ihuxv.ATT.COM>
Source record: 249165

I have version 3.0.6 of Mark Williams C which I upgraded from 2.3.
With 3.0.6 I get strange hangups to the printer occasionally when
running programs under their shell. I have never had any problems
running the same programs directly from GEM.
They come from the MW db program as well as some that I have written.
The nature of it is that when you issue a write command to a printer,
it just hangs for a while like something is going out but nothing ever
shows up at the printer. This is very intermittent and I can never
recall it happenning with the 2.3 version I have. Has anyone else had
this problem. I understand MWC is up to 3.0.9 now. Is this fixed in
that version?

Also the atof() function in MWC will return 0 if the string starts
with a blank. This is in spite of an explicit statement to the
contrary in the documentation. Fortunately, it is easy to get around.

792. Appletalk for the ST

Newsgroup: comp.sys.atari.st
Date: 1989-04-21 22:29:34 UTC
From: karl@es56.UUCP
Message-ID: <8904212229.AA22257@es56.escd.uucp>
Source record: 249166

Now that the ST has a Postscript emulator, what about a box to connect it to Appletalk? The Mega ST and laser printer make a decent postscript device, but they have to be fed through the parallel or serial port. This cannot really compete with other printers that can be connected directly to Appletalk.

Appletalk is a standard, and there are plenty of installations. The cabling for it is dirt cheap. Appletalk connectivity for the ST would make the system a lot more attractive to business.

Lets put it this way: Every other issue in which the 'open letter' appeared had the full text. Only this magazine - which appeared after my rebuttal of weeks ago, were the figures edited out of the letter. This was not a 'make it fit' edit, this was a delibirate omission of the figures which proved Mr. Louie's point wrong. The part which was left out was not lengthy (two or three lines at the most) and the paragraphs around the missing part were nicely 'smoothed'.

Spectre 1.9 is currently shipping which offers beta sound support. GCR will be shown at the World of Atari this weekend but will not be ready for sale until June/July. It will carry a reported and still rumored price of $299 with a $75 trade-in for current owners of Spectre. PC-Ditto II is now in mass production and should be ready for sale at the same time as GCR for the same price, $150 discount coupons will be sent to current pc-ditto registered users sometime very soon.

Message-ID: <17455@cup.portal.com>
Source record: 249172

Supra drives are the ones that are limited to an 18" cable, and they also should not be used as monitor stands due to their shape and size (shoebox.) The ICD FaST case is perfectly suited as a monitor stand and ICD's adaptor and shielding allow a cable up to 6' (feet!) in length.

Message-ID: <17458@cup.portal.com>
Source record: 249173

Ron Kushnier asks:
>Does anyone know how to get onto the Prodigy Information System using
>PC Ditto?

I assume you have the Prodigy Startup Kit.. that's the ONLY way to log onto the service.. a normal terminal program can't be used..

The key to using Prodigy with pc-ditto is *patience* ... more patience than I think I may have... even with 2400 baud data transfer, the Prodigy software runs very slowly on pc-ditto...

If it appears that nothing happens when you first run the software (this is assuming you've already followed the installation procedure, typed in your local access number, etc.. to create the "work disk"), WAIT... (and wait)... eventually, after several minutes, the modem will dial..

At first, I thought the software had locked up, or perhaps it was addressing the wrong COM port... finally, I walked away in disgust, only to hear the modem dialling a little while later... apparently the software has to initialize for a while before dialling...

Because there is no "Text" mode, screen displays are excruciatingly slow.. everything on the screen is mapped out in graphics... it took about fifteen minutes for me to read a 3-page letter of welcome from the system.. (no kidding.. I timed it..!), and each page is only about 8 lines of 40 characters each..

This is not to say that the service is bad.. in fact, it looks like a VERY interesting information service, especially at the price.. $9.95 per MONTH, flat rate... it's just not usable with the current version of pc-ditto..

Now... with pc-ditto II, that will change...

800. Atari memory comments/questions...

Newsgroup: comp.sys.atari.st
Date: 1989-04-22 02:42:00 UTC
From: wzg90@TTACS1.TTU.EDU
Message-ID: <8904220150.AA12005@ucbvax.Berkeley.EDU>
Source record: 249174

I have a 520ST (3 years old) and have opened it up many times in the past. Only recently did I realize something that may be important: the 520ST uses 150ns 256Kx1 DRAMs....

This by itself isn't a problem, but the CPU runs at 8MHz, which translates to 125ns per clock cycle. Well, to make things short, this means that the ST is running its RAM with one wait state, correct?

Unfortunately, at 4 clock cycles per memory hit (average), this translates to a 20% decrease in performance compared to what it could be with no wait states...

Well, it'd be pretty nice to have that extra 20% performance, so the question is: does the Mega STs use the same type of MMU that is used in the 520? The MMU is, in all likelihood, responsible for generating the wait state cycle, so it seems that if the Mega is using faster RAMs (say, 100ns so that there'd be an ample 25ns for address decoding and buffering) and the MMU ISN'T generating a wait state cycle, then I should be able to replace my RAM with 100ns RAM and put the Mega MMU in and everything will be 20% faster. Have I missed anything??

Funny that I've never heard mention of this on the net before. Am I missing something vital here??

>have any input on this?

While I understand your desire to know what to expect from Atari and
your frustration at the lack of outward signs of progress from other
than the rumor mill, realistically I don't think this is in Atari's
interests at all. No corporation wants their strategies and progress
known in this fashion.

o A company's plans and problems are usually considered its own
business. A company's fiscal health could be very
adversely affected by releasing information about the
current state of ongoing projects.
A series of good progress reports followed by word of a
setback could have catastrophic effects on the company's
stock performance.

o After all the flak Atari has taken about vaporware products
etc. can you imagine how much trouble weekly progress reports
like this would get them into with exactly the same people who
want this information? Atari would inevitably take flak over
any decision they announced in this fashion
from the same people who asked for the information to be
publicized... ("Not enough graphics modes!" "Too
expensive!" "We demand a better upgrade path!" etc.)

Atari is still trying to get their act together. I think from what
I've seen lately they're doing better for themselves by playing it
close to the chest... it gives them a little more room to maneuver
without having hordes of Atari owners or Atari watchers nipping at their
heels with complaint after complaint... while this 'weekly news from
Atari' might be a nice PR gesture if it contained anything of substance
it could cause no end of headaches for the company.

> Where I'm living now, there are many keyboards from old terminals available,
>but I suppose it won't be possible to replace the ST keyboard with it.

Hey, that's me being referred to!

A few months ago, I did some serious hacking on the keyboard of my ST
(as well as that of the XE computer). What I did was to punch out some
rubber dots using a hole punch and 1/16 inch rubber sheeting. On the
bottom of the keyboard assembly, there are 20+ small screws that holds
the circuit board to the key cap assembly. Using a precision
screwdriver, I put a small hole in the middle of the rubber dots. Then,
I used them as washers, fitting them between the circuit board and the
key cap assembly board. Here is what I found:

520ST - works moderately well; removes some of the spongyness.
1040ST - not much effect
XE with rubber cups - no real effect
XE with springs - FANTASTIC. Made the keyboard feel EXCELLENT.

All in all, the upgrade wasn't very effective except for the XE keyboard
with the springs. I pretty much gave up on upgrading the keyboard after
I managed to trash my first one (accidentally dissolved the silicon
contact).

What I have found is: if one was to put the silicon contact on the
bottom of the plastic key cap mech, and put a spring underneath the
key cap itself, the keyboard would be GREATLY improved, and pretty
usable. :^)

> Yes.
>

Ken, on July 19, 1988 I sent a letter (using the words prescribed by
Atari Canada) requesting the developer docs. It read:
(quote)
Atari Mega/520/1040 St Developer Documentation $100.00
Support (including Newsletters) $150.00
(unquote)
Since I had MWC, I did not order Alcyon C.

Note that 60% (!!!!!!) of my order was for "SUPPORT"; well read on...

When I received my package, it was accompanied by an Invoice which
magically changed Support to read: Atari Developer Registration
Package. I didn't know it then, but this _change_ was prophetic;
"Registration" lacked the "Support" in my order.

For this, I received a package of docs which contain little more than
volume 2 of the Abacus series "Atari ST Internals". In fact my
"package" is almost completely virgin; there isn't even a single note
penciled in. The Abacus book is starting to look pretty ratty from use.

To be fair, I *do* use the docs as the "formal" rulebook. However, how
good can this set of docs be, when most of the information is dated
as follows:

88/02/24 GEMDOS (I'm suspicious of this one.)
85/11/26 BIOS Real helpful with 1985/11/20 ROMs, but what about
1986/02/06, 1986/04/24, 1987/04/22(Mega) ROMs??
Atari documents SYSVARS 400-501, but Abacus tells
us about dump_vec, prt_stat, prt_vec, aux_stat,
aux_vec, memval3, bconstat_vec, bconin_vec,bcostat_vec,
and bconout_vec in the 502-59D range. Are these
legit? If so, when can I expect an update to this
section??
87/12/17 LINE-A
85/09/05 PRTBLK
85/05/?? VDI
85/05/?? AES
86/01/07 Hardware *NO* schematics (see more comments below)
The ONLY timing diagrams in this section are for
"Mouse Phase Directions"; everything a HARDWARE
engineer needs to know...
87/06/17 Blitter
87/10/02 Mega Bus Documents the 68000 signals...
85/09/27 ACSI Notes Contains the *VERY FIRST* "hack" of the "ST SASI
hard disk driver"; last update = 85/07/23. When I
phoned Atari Canada asking for an updated code listing
for this driver, I was flatly refused.(Support...?)
85/02/26 IKBD Refers to "Related Documents":
Atari Corp. RBP/GHU/SD Keyboard Schematic (9/14/84)
Atari Corp. RBP/GHU/SD Keyboard Layout (unnumbered, no
date)
Why put this info in the docs if they're not provided?
88/04/13 APPI
(no date) CDAR504

>|From what I saw of the developer's docs (I saw a

>

OH REALLY!? In my kit, the ACSI is a copy of a copy of...

Granted the remainder is of the best quality photocopy; considering,
the print quality is very good. I believe that the quality of the
Atari developer documentation is the direct cause of the current state
of Atari products. Correct me if I'm wrong, but I sense the symptoms
of the deadly NIH syndrome.... (Not Invented Here)

>|Given the tiny percentage of the market that the ST has, and the tiny number
>|of (mostly tiny) companies that write software for it, can you really afford
>|to "certainly break software"?
>
> Context! We definitely can afford to, and most certainly will, break...
>|>software that either a) didn't follow the rules in the first place, or
>|>b) was built on bad assumptions about the internal workings of TOS.

OK, I can buy that... but is that why Atari has not supported its
developers? Is that why not everything is documented (502-59D)??
It sounds to me more like "since we gave you a little more than half of
the _cast-in-concrete_ stuff, then we can break the rest".
What is Atari's position regarding the vectors between 502-59D?
"Assumptions" seems to be required reading for us developers...
Where can I get a copy? :-)

I have more information to pass on...

On 88/08/19, I sent a letter to Atari Canada with the following:
(quote)
I would like to take this opportunity to inform you that I find most of
the information provided to date is generally available in various
publications such as Abacus.
(unquote)
Again, "provided to date" proved to be quite prophetic.

I phoned Atari Canada in late January of this year stating that I had
NEVER received an Atari newsletter (I don't even know what one looks
like). I was told that they were being worked on and would be sent
out Mid-February. (I forgot to ask which year, but I am asking now.)

In the same letter...
(quote)
I find your hardware section to be quite sparse; is more information
available, or am I required to reverse-engineer the ST interfaces in

order to ensure the success of my development efforts?
(unquote)

On Aug 25th, I received TOS 1.4 with a letter that read in part:
(quote)
The only interface that may give you difficulty is the ACSI port.
A document giving more details and depth is being prepared by Atari
Engineering and will hopefully be available in the next few weeks.
(unquote)

...a few weeks...? It has been nearly nine months. Is the gestation
period nearly over? or, are we dealing with a "elephantus documentum"?

(quote)
All the other interfaces should be obvious.
(unquote)

EXXXCCCUUUUUUUSE ME??????? For this I paid the $150 supplementary?

(quote)
And finally, the reason you find most of the information in other
publications is because it had been taken from the development kit in
the first place. You will also find that the development kit is much
more accurate than the Abacus books.
(unquote)

I ONLY have Abacus books 2 and 13, and they cover more ground than the
official developer's kit, so I have a hard time with this statement.

The bottom line...

- The developer's kit (although official) does not warrant the
money asked at this time.
- Even comments of "reverse-engineering" did not result in my
ever being told of schematics availability (I think I saw a
comment about this in another mailing). If schematics are
available, do they cover all models, or just the original 520?
- Have newsletters ever existed? How can I get back issues?
(even photocopies)
- Will the "missing" vectors be cast in concrete? Are there any
Abacus may have missed? When will new docs be in the hands of
developers? Before answering, reread the previous promisses.
- Will developers have to wait in line for the TOS 1.4 ROMs?
- Will the "new" docs be more than typed up engineering crib notes
making up part of the original kit?
- Are Canadian developers supportable only from Atari Canada, or
is there a support organization closer to your development group
to which we foreigners can have access?

My nine months are almost up, will I be born or stillborn? It is now
all in the hands of Dr. Atari... :-) or ;~(or... I'll tell you...

804. DRAFIX and HP DeskJet

Newsgroup: comp.sys.atari.st
Date: 1989-04-22 03:27:00 UTC
From: FORTINP@BNR.CA
Message-ID: <8904241255.AA14118@ucbvax.Berkeley.EDU>
Source record: 249178

Hi,

I am trying to decide whether or not to buy a friend's DRAFIX package;
the clincher would be if I could find a some software which could
either convert the plotter output to something understandable by my
HP DeskJet, or allow DRAFIX' printer output to support the DJ directly.
I have the FX-80 cartridge for the DJ, but the its graphics are
terrible.

Does anyone know of such a conversion package, or a DJ printer driver
for DRAFIX?

Thanks,
Pierre

If you're running a STadel, it attempts to redirect i/o to the rs232
port when you shell out from remote. If hack & larn still talk to the
screen, you're S.O.L. unless you wanna hack the BIOS calls. If you're
not running STadel, try the following code:

------[cut here]------

```
/*
* rexec: execute a program with stdin/stdout pointed at AUX:
*/
#include <atari\osbind.h>

main(argc, argv)
{
char tail[128];
char *command;
int save0, save1;

if (argc < 2) {
Cconws("usage: rexec command [args]\r\n");
exit(255);
}
save0 = Fdup(0); /* save old file descriptors */
save1 = Fdup(1);

Fforce(-2, 0); /* force AUX: (-2) into stdin (0) and stdout (1) */
Fforce(-2, 1); /* PARAMETERS MAY BE REVERSED! */

++argv, --argc;

command = *argv++;
argc--;

tail[0] = 0; /* fabricate a command tail */
while (argc-- > 0) {
strcat(tail, " ");
strcat(tail, *argv++);
}
if (tail[0])
tail[0] = strlen(tail)-1;
```

```
Pexec(0, command, tail, 0L); /* Zoom! */

Fforce(save0, 0); /* restore stdin/stdout */
Fforce(save1, 1);
Fclose(save0); /* and toss save-handles */
Fclose(save1);
}

------[cut here]------
```

If your applications are well-behaved (talk via GEMDOS calls instead of BIOS calls), this will do the trick. I use a variant of this routine from inside STadel for shelling out, and I regularly shell out from remote (when Pell is working, that is) even if I'm calling from long distance.

>Reply as e-mail to sfn20715@uxa.cso.uiuc.edu please.

Hope you don't mind that I replied publicly - this sort of code is useful to the world in general...

IF this little machine turns out to be what I need, it will be
a gem! YOU have any idea what this Portfolio means to me?
I'm speech impaired due to cerebral palsy. I am mobile, so a
clumsy heavy Laptop and / or DECtalker, wouldn't do me much good.
Have struggled ok with a tiny tandy for four years, but it really
is much too tiny to type on, and only holds 2 or 3 k... 3 lines
3 -short- lines of text........

And if my eyes didn't decieve me , I saw a speaker on the side...
If it can do speech synthesis, it will be a double blessing...
I will at long last- have a voice- and be able to carry on more
'normal' in-person conversations.........maybe even give poetry readings.
'So, say a prayer....

My dad asked the following questions;
does it have a serial port? Does it have a paralell port?

Does it have internal disk drives...<-- answered in article, i know ;>
Is there room to add ibm compatible 1/2 cards?
Anybody selling it at discount for handicapped?

WOW!, the possibilities are astounding....... I've only waited
33 years for something like this...... Knew the tech was here, but
didn't think anybody was gonna put it all into one tidy
package so soon! YAY!......... Hey, I can dream, can't I?

> program that will redirect output from screen to the RS232?

I don't know about Larn, but it should be possible to redirect the output
and input of NetHack to the RS232 port by means of Fforce(), e.g. something
like Fforce(0, Fopen("AUX:", 2)); Fforce(1, Fopen("AUX:", 2)). The
major potential problem is that NetHack (I'm assuming you're using the version
I posted to comp.binaries.atari.st) uses a Crawcin call, which may not be
properly redirected in all versions of TOS. It's worth a try, though.
Failing all else, the sources for NetHack and Larn are available on
terminator.cc.umich.edu; you could always recompile them with appropriate
modifications!

From: humtech@ucschu.ucsc.edu
Message-ID: <6954@saturn.ucsc.edu>
Source record: 249183

Greetings! I recently picked up STTEX and would like to start using it. I take it that I need a mono monitor for this. I've been pricing them and the best I've been able to do is $169.95 from some place in New York.
Is this a good price or does someone know of better one?

Also, I know there is a dvi-to-postscript program for tex/dvi on UNIX. Is there such a thing on the ST? Is it possible to compile the UNIX source for this on an ST?

On another subject, I just happened to catch a second or two of "Computer Chronicles" last night. They mentioned Atari's Portfolio - mostly the basics like it has a QWERTY keyboard and the like. They did say that it had an 80X8 (or something by 8) display. The commentator also mentioned that another company was going to make a similar device later this year that would have a 24 line display.

Thanx very much,

>special drivers),then Malloc more memory. the children will never Malloc/malloc
>any memory but must be able to read/write to memory loc passed to it by parent:
>

hmm, interesting. this is pretty well the exact same problem that i've come
across in the GEMDOS pexec: namely, you cannot tell GEMDOS to load in a program
at a specific address. this makes overlays a real bugger, since i can't
allocate, say 32K of memory as an overlay buffer, and tell gemdos to load a
program into this buffer for execution. the ability to do this would allow
people to write really HUGE accessories, but instead of eating up 200K for
the huge accessory all at once, the modules it need to run can be pexeced
when needed into an internal buffer. no muss, no fuss.

but, i have a feeling this would interfere with any attempts by atari to make
TOS multitask/swap processes/etc. or is that being too optomistic?? :-)

>all these types of questions SHOULD have been answered in the Pexec Cookbook
>or else you should just release the src to developers so we don't have to
>bug you. i really need an answer before the weekend so i can get this
>stuff working. i am on a tight schedule for my customer.
>

again, interesting. if simple questions like this aren't answered in the "all
powerful atari developer documentation", then what is covered??? hearing
of problems like this from developers (i assume from bill's posting that he
is indeed a developer) makes me VERY hesitant on spending $100+ on
documentationthat is no better than the abacus books.

815. color setting

Newsgroup: comp.sys.atari.st
Date: 1989-04-22 19:15:39 UTC
From: saj@chinet.chi.il.us
Message-ID: <8268@chinet.chi.il.us>
Source record: 249189

Being too lazy to jump right into this, I'm asking you to help me set up the color palette within a GEM application. The nicest way would be to use the control panel accessory, since it's familiar to most users. Anyone care to tell me how it sets colors? From the ways it doesn't work in various situations I get the idea that it sends messages to the desktop, and the desktop does the color setting. In that case, I'd be delighted to hear what the messages look like, and maybe some hints about how to steal only the color setting messages and not upset the desktop too much. If the control panel isn't usable, next choice is publicly re-usable code to set the palette. I've seen references to it existing, but I haven't seen the code. Anyone care to tell me where I can get it (bbs, uucp or mailserver)?
I should warn you that while I'll give credit freely, this is for an application that I hope to make some money from. At present, though, it appears that it will be distributed with full source code.

I have the Developer's Kit and the book << Programmer's Guide to GEM >>
but neither can enlighten me on how to do the following:

1) How do I get the address of a string contained in a dialog in order
to change its contents? What I'm doing is:

```
:
rsrc_gaddr( R_STRING, STR_OBJ, &string );
sprintf( string, "%4d", value );
:
```

2) How do I send myself a WM_REDRAW message? What I'm doing is:

```
SendRedraw( tree, obj )
long tree;
int obj;
{
int msg[8];

ObjcXywh( tree, obj, &msg[4] );
msg[0] = WM_REDRAW;
msg[3] = GemHandle;
appl_write( ApplHandle, 16, msg );
}/* SendRedraw */

someroutine()
{
:
/* dirty screen, change string values in object */
:
SendRedraw( TreeObj, ROOT );
}
```

Is any of this right?

820. Bad RAM?

Newsgroup: comp.sys.atari.st
Date: 1989-04-23 02:11:00 UTC
From: sfn20715@uxa.cso.uiuc.edu
Message-ID: <111500017@uxa.cso.uiuc.edu>
Source record: 249196

I recently upgraded my ST from 512K to 2.5 Meg. Among other things, I noticed that there is a significantly long pause when executing programs (i.e. double-clicking from the desktop.) With a large ramdisk, i.e. with very little memory free, the pause is much shorter. Is this a system function or is it due to some aspect of the upgraded memory banks not being efficient enough? The upgrade I used is called "EZ-RAM", and while it did involve some soldering, I am reasonably sure I made no mistakes.

Another problem that may have been caused by the upgrade: Whenever I play certain games, especially Dungeon Master, I seem to get lots of flashing lines on the screen, which multiply to blot out the entire screen and eventually crash the program. I know this did not happen before I upgraded my ram.

Could it be a bad solder joint somewhere? Bad chips? Shaky sockets or a problem with the power supply?

Please reply as e-mail to sfn20715@uxa.cso.uiuc.edu

821. The Anaheim World of Atari Show -- A report

Newsgroup: comp.sys.atari.st
Date: 1989-04-23 02:50:20 UTC
From: rjung@nunki.usc.edu
Message-ID: <3571@nunki.usc.edu>
Source record: 249197
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

I have just come back from attending the first(?) World of Atari show, at the Disneyland hotel in Anaheim. Since there's probably some interest from all Atarians at what took place, I'll spill my guts (somebody clean that mess up).

The show runs April 22, 10:00am - 6:00pm, and April 23, 10:00am - 5:00pm. I arrived through the doors at about 10:30am, paid $5 for a ticket, and walked in. This was a "buyer's show", which meant that every other booth was trying to get you to buy something. The crowds were already 5-men deep at 10:00 in the morning, though it tapered off to a more manageable level later in the day.

WHAT'S NEW?
I would estimate that over 40 different firms and groups were at the show, each showing a combination of new and old products. To keep this thing from going too long, I'll just touch on the highlights:

ATARI CORP. was showing off the Moniterm 19" monitor, the Calamus DTP program, the new Megafile 44 hard drive, and their up-and-coming WordFlair word processing program. Everything was running fine, and Atari expects to have the last two products available around June or July of this year. (For information about the STacy, the PC Portfolio, the TT and the ATW, see below)

GADGETS BY SMALL was demonstrating the Spectre GCR. The cartridge has a cable to let you hook up an internal- or external ST disk drive so that it will read Mac disks directly. It is expected to be available in August (FCC approval pending), with a retail price of $300. Owners of the Spectre can trade it in for $100 credit towards the GCR.

AVANT-GARDE was showing PC-Ditto II, running Microsoft's Flight Simulator on the Atari ST. I am not familliar with how fast an IBM PC runs FS in its native enviroment, but this demo was not slow in any noticeable way. According to their literature, PCD2 has a Norton SI rating of 3.0. The price is $300.

SUPRA was showing off their line of hard drive equipments for the Atari computers. Nothing new to report, though.

The DIAMOND GOS was being demonstrated (no sign of GOE anywhere). It looks a LOT more like the GEM system now, and appears to be available for sale. It comes with (I think) a paint application and a word pocessor. It comes on a piggy-back cartridge, and is transparent as DOS to the system. Rumors fly that Atari wants to market the Diamond with future 8-bits.

ARTISAN software was demonstrating two ST programs: Word Quest, which makes word search puzzles, runs in color and monochrome; and Graph Maker, which (natch) makes graphs.

HAPPY COMPUTERS was selling the Discovery cartridge (for the ST) and Happy upgrades (for the 8-bits). They also announced a new product called Quick*verter, which allows for easy conversion between Spectre, Magic Sac, GEM, and Macintosh format disks.

GRIBNIF SOFTWARE (what does "Gribnif" mean?) was showing and selling NeoDesk version 2.0. It allows custom file icons, keyboard reboot, fast windowing routes, and lots of other features. All this for $50.

SEYMOR/RADIX presented a new piece of hardware called DVT VCR. It allows you to back up your hard drive on VCR tape (up to 360 megabytes). The box connects your system to the VCR by the cartridge port. Price is $250.

IMAGEN was selling Ultrascript for the Atari SLM804/Dot matrix/HP Inkjet printers. Apparently Atari Corp. will control distribution of the "SLM 804-only" version, while Imagen gets to hawk the Dot matrix/HP Inkjet version by themselves. Rumors were that Ultrascript will also work with the HP Laserjet with no problem. Price is around $200.

CODEHEAD SOFWARE was showing Hotwire and MIDIMax. Hotwire is a utility of benefit for hard drive users; A given file/pathname can be assigned to any user-defined keystroke, and executed from the Desktop with one press. MIDIMax allows the creation of MIDI "macros" for storage or playback, which can be triggered by any MIDI event. Both products are priced under $50.

SIERRA ON-LINE was showing a videotape featuring the latest of their adventure programs: Gold Rush, Space Quest III, King's Quest IV, Police Quest II, Leisure Suit Larry II, and Manhunter: New York. The games that aren't already available for the ST will be converted "very soon".

A new(?) company, ARTISTECH DEVELOPMENT, was showing off Da Vinci, an art/animation/drafting tool. Written completely in assembly, this program ofers a lot of "features for artists by artists" (work on 12 pictures at once on a 520 ST!) at high speed. This is expected to be released in July for about $100.

MIGRAPH had Touch-Up for sale, and announced a forthcoming hand-held scanner. The Migraph Scanner package will scan any type of printed material, and turn it into .IMG, .PC*, .TIF, MacPaint, Printmaster, and more. It will come bundled with scanning software and an image-editing accessory. No price or release date announced.

BECKMEYER DEVELOPMENT TOOLS talked about Micro C-Shell, MT C-Shell, Micro Make, and Micro C-Tools.

Both ANTIC SOFTWARE and STart were present, though in seperate booths. Antic had no new ST programs to demonstrate, though I did notice "Interiors Design Disk", a CAD-3D collection of chairs, shelves, and other such forms. They also announced that the GFA BASIC 3.0 compiler will be available in June/July.

ST-LOG and STart were offering discount subscription rates.

DISCLAIMER:
There were many other firms and dealers who were present who I did not

mention above, due to either ignorance, forgetfulness, or misinformation. If anyone wants to correct/add on to this, go ahead.

BESIDES THE BOOTHS...
Sig Hartmann gave a speech to a packed crowd on "the future of Atari". He reaffirmed Atari's policy of not announcing any product "unless it will be available for sale within 60 days". Thus, while he acknowledged some truth to the rumors regarding the Atari TT, the ATW, an Atari networking system, and new graphics resolutions, he did not say anything specific. Sig also reported that the US market will get the FIRST shipments of the STacy and the Portfolio, to the tulmultious cheer of the crowd.

Atari personnel also reaffirmed their desire to "attack" the US market in 1989, primarily through the STacy, the PC Portfolio, and increased public relations. Though their advertising budget "has tripled", Sig says that Atari will keep advertising in the hands of local district managers. Thus, no prime-time nationwide commercials or TIME Magazine spots in the near future.

Though I had to leave before this happened, there is/was a music concert scheduled for 7:30pm on April 22. Only 1000 people allowed in, with tickets at $5 each. Music by Mick Fleetwood and Michael Pinder (of Moody Blues) was supplemented with a limited-engagement showing of the STacy (it's up and running), the PC Portfolio (also), and the first public playing of the new Holtz MIDI Board.

Anyway, it was a lot of fun, even though the freeway drive was terrible (this IS Los Angeles, right? B-), and Disneyland's prices were extortionary. There is already talk of another World of Atari Show next year; I sure hope so!

822. Re: WordPerfect revision -- Now clock problem & fix.

Newsgroup: comp.sys.atari.st
Date: 1989-04-23 02:51:09 UTC
From: close@cacilj.UUCP
Message-ID: <978@cacilj.UUCP>
Source record: 249198

In article <3237@cs.dal.ca> bill@biomel.UUCP, biomel@cs.dal.CDN writes:
>I appreciate John's information about the clocks, but I remain a bit
>confused about what is happening. The Paul Close program that his wife
>posted gives me separate readings for three clocks when I boot with the

There are only two clocks. The MWC routines have two ways of reporting
and interpreting the keyboard clock. One way returns a value of 1900, and
the other returns a value of somewhere in the year 2000. One routine
(gettime) ``reads and returns the intelligent keyboard's setting of
the current time. It returns a 32 bit mask whose bits indicate'' various
things. The other routine (Kgettime) ``reads the time from the intelligent
keyboard's clock ... and returns a pointer to the structure tm_t, which
it initializes.'' *That's* the two are different values.

Kgettime converts between time as encoded in tm_t and the IKBD clock,
while gettime directly manipulates system time. It's a slight difference
that had me confused at first, and convinced that the ST had more than two
clocks. Now I'm set straight, and I hope you are too.

My husband's program won't, by the way, freeze the keyboard clock 'cause
it only *reads* one clock and writes the other--the freezing problem happens
when you write both clocks.

823. MacTrek runs under Spectre 128 emulator on Atari ST

Newsgroup: comp.sys.atari.st
Date: 1989-04-25 21:04:52 UTC
From: mha@batcomputer.tn.cornell.edu
Message-ID: <7817@batcomputer.tn.cornell.edu>
Source record: 249192
Cross-posted to: comp.sys.mac,comp.sys.atari.st

Some users have been reporting that the MacTrek Star Trek Trivia Game for the Macintosh that I posted to the INFO-MAC archives and the comp.binaries.mac newsgroup a couple of weeks ago works flawlessly on an Atari ST using the Spectre 128 Macintosh emulator. Atari ST and Spectre users are welcome to download the program from either of these sources.

Atari/Spectre users who have no way of downloading and then processing the program themselves should contact me, and if you send me a blank Macintosh diskette and a SASE I can send you the game. Users who also for whatever reason can't read Mac disks may have a problem!

Please report any odd behavior while using MacTrek with the Spectre to me. Note that some odd behavior may have been part of the original program, and may not be due to the emulator. :-)

Note that I have set the follow-up newsgroup to comp.sys.atari.st, and all follow-up messages should go there unless they really pertain to the Mac.

I somehow doubt that the folio has a real keyboard. More likely, it will
have a small alphanumeric keypad. Check the press release; it's supposed
to be a "handheld" computer.

Have you seen the Cambridge z88? It's about the size of a textbook, and
weighs about 2 pounds. 80 columns, something like 8 lines. I saw one
at a local store, but I've never used one extensively. It's an interesting
machine. (I think it uses AA type batteries)

John Kawakami

825. Atari PC Folio info.

Newsgroup: comp.sys.atari.st
Date: 1989-04-26 01:51:00 UTC
From: Friesen@PCO-MULTICS.HBI.HONEYWELL.COM
Message-ID: <890426015154.261651@PCO-MULTICS.HBI.HONEYWELL.COM>
Source record: 249199

Here is info. that I got from ST World Mag:

It is about 8 1/4" long by 7 1/4" wide by 7 1/2" tall (when the screen is folded open). It weighs 450g. It uses MS DOS 2.11, is based on the Intel80C88 and runs at 4.9MHz. It runs off of AA batteries that last 6-8 weeks! It comes with 128K RAm and can be expanded to 640K. It has 256K ROM that contains the extended BIOS version, MS-DOS OS, a word processor, a Lotus 1-2-3 compatible chart calculate program, a date manager program (with clock), an address database, a telephone book, a calculator and terminal program. It uses an LCD screen with supertwist technology. It displays text at 40 chars. by 8 lines. It has a resolution of 240 X 64. It uses credit card size moduals instead of disks to store data. It has a 60 pin buss that allows easy connection to printers, modems, or other PCs.

I think those credit card data thingies are pretty expensive ($150+) so software will be high priced, however, this is just speculation. I also heard that it will be priced at $400. This is a good deal because you are getting a faster more versitile smaller computer than the Tandy 102 for $200 less!

It looks just like a miniater laptop--the screen folds up, it has a standard keyboard, and it even has a numeric keypad starting on the UJM keys (I suppose there is some sort of alternate key to access those).

>worked in making an archive. Also, what kind of memory requirements
>does this program have? I have a 1 MEG machine and it tells me that
>it runs out of memory on certain attempts.

I got bitten by this one too. The expert command switches in zoo
are case sensitive. I surmise that you're either running zoo.ttp from
the desktop with the old TOS (which capitalizes commandlines -- ~*@$+&@
#@&%!!); or else from a shell which capitalizes arguments before passing
them to programs; e.g. PCOMMAND, CPP2, CLI.ACC from STart magazine....
Novice commands in zoo aren't case sensitive, so they'll work fine from
the desktop or from one of those perverse shells. The reason "v" works
is that zoo has both "v" and "V" as expert switches.
(Why is that so many otherwise good cli's display this perversity?
BTW, if anyone has a _small_ shell which passes arguments verbatim, would
they please post it?)
(Another aside: Why don't programs like zoo have a simple command
line prompt built in, invoked when they're called without arguments?
Three or four lines of code could sure save a lot of hassle.)
As for running out of memory, I haven't had any trouble so far.
I zoo'd the complete ELAN1V5 distribution, subdirectories and all,
into a c220K archive with nary a problem. (The .zoo archive was
smaller than the original .arc distribution, BTW, even though zoo
stores pathnames; anyone have an explanation for this?) This was on
a 1040ST with a 400K ramdisk installed; biggest file was the ELAN
executable, at around c150K I think.

827. v06INF1: Introduction to comp.binaries.atari.st

Newsgroup: comp.sys.atari.st
Date: 1989-07-22 17:45:47 UTC
From: koreth%panarthea.ebay@sun.com
Message-ID: <33925@grapevine.uucp>
Source record: 248323
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

```
Submitted-by: koreth%panarthea.ebay@sun.com (Steven Grimm)
Posting-number: Volume 6, Info 1
Archive-name: intro

This is the first of three introductory articles about comp.binaries.atari.st.
This one describes how to submit binaries to the newsgroup, where the
archive sites are, and how to contact them. A companion article lists
all previously-published binaries, and a third article explains how to
retrieve and unpack binaries.

I am always looking for suggestions on how to improve the usefulness
of the newsgroup, and can be contacted as listed below.

-- Steven Grimm

--------------------

Subject: Submitting binaries for publication

Items intended for posting or queries and problem notes should be sent to
atari-binaries@ssyx.ucsc.edu. If you are on a UUCP-only site, you can send
them to uunet!ucbvax!ucscc!ssyx!atari-binaries.

If you want verification of arrival, so say in a cover note, or at the
beginning of your submission, if it is small. I try to verify that a
program works, and if I can't get it to work, I may hold up posting it
for a couple of days. Please note that, except in rare cases, software
without documentation will not be published. The backlog from receipt
to posting varies from one to four weeks depending mostly on the set
of submissions currently in my queue.

If you are submitting both sources and binaries, please send the two
separately. If I have to separate your sources from your binaries by
hand, your submission will most likely sit on the back burner for a
while.

--------------------

Subject: The structure of comp.binaries.atari.st articles

Each posting in comp.binaries.atari.st is called an "issue"; there are
roughly 100 issues to a volume. The division is arbitrary and may vary.
There are two types of articles in comp.binaries.atari.st: binaries and
"information postings." They can be distinguished by the subject line:

Subject: v06INF3: Index and other info
```

This first word in the title identifies this as the third info posting of volume six. Similarly, the subject line shown below:

Subject: v06i081: fix40 -- Fix for forty-folder bug

identifies this as the 81st binary article in Volume 6. Large programs are broken up into smaller pieces, and have subject lines that look like this:

Subject: v06i041: mtgem -- Multitasking GEM replacement part04/18

Certain information about the system configuration required to use the program is given on the keywords line.

Keywords: uuencode, 1meg, medium, high

This means that the program requires at least one meg of RAM and runs in medium or high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

uuencode - program is uuencoded (UNIX uudecode required to unpack)
uue - program is uuencoded (ST uud required to unpack)
arc - program is archived (arc required to unpack)
zoo - program is a zoo archive (zoo required to unpack)
high - high resolution
medium - medium resolution
low - low resolution
1meg - needs 1 meg of RAM

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: good@atari.UUCP (Roy Good)
Posting-number: Volume 6, Issue 80
Archive-name: new-desktop

The "Submitted by" is the author of the program. If you have comments about the binaries published in comp.binaries.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this program in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

Since most archive sites run UNIX, articles are given UNIX-style filenames rather than ST-style filenames. I do make an effort to keep filenames to 8 characters or smaller, however.

Subject: Reporting and tracking bugs and patches to postings

Updates to programs are usually announced in comp.sys.atari.st. When large changes are made to a program, the entire thing will be reposted to comp.binaries.atari.st.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the programs I moderate, so don't send your bug reports to me.

If the program documentation mentions some file that isn't included in the posting (for instance, a font editor's documentation might refer to some sample fonts), contact the submitter, not me. I post articles in their entirety, so if it isn't posted, I probably don't have it.

Subject: Archive sites

If you miss part or all of a posting, or would like to see what has been posted to the group in the past, archive sites are helpful. Please try to retrieve files from the archives before asking me for them.

1. Site killer has a full archive available for anonymous UUCP. For information on accessing it, send mail to archive-request@killer.dallas.tx.us.

2. Site ssyx is running an archive server, and (since it's the moderator's machine) offers full archives of both the sources and binaries groups. For instructions, send a message with the word "help" in the message body to:
archive-server@ssyx.ucsc.edu
or
uunet!ucbvax!ucscc!ssyx!archive-server
Ssyx also supports anonymous ftp; its internet address is 128.114.133.1. More complete instructions for are given in an upcoming article.

If you are making an archive available to the public, or would like to, please contact me.

828. Re: Floppy disks on 520ST

Newsgroup: comp.sys.atari.st

From: rosenkra@hall.cray.com
Message-ID: <4041@hall.cray.com>
Source record: 248951

In article <955@prlhp1.prl.philips.co.uk> stevens@prlhp1.prl.philips.co.uk (Francis Stevens) writes:
=With all the PD disk formatters available which enable you to format
=a floppy in a non-standard way (i.e. 10 sectors per track, 84 tracks per
=side) which gives more than 720K per drive, does anyone have any advice
=or warnings about doing this ? An extra 80K or so per disk seems a good idea
=but they must have settled on 720K for a reason (?). Any comments ?
=
=Francis Stevens
=stevens@prl.philips.co.uk

i know i'll get razzed on this but...

as far as i know, not all floppy drives are created equal. i have been lead to believe that hnot all can access beyond track 80. if you use your ST alot, odds are you will have to replace the floppy eventually (i am on my 3rd in 3 years on my 1040, my mega4 is about due as well...), especially w/o a hard disk. this means you could get a drive which may not be able to get at track 80+. you can also get blank disks (in the states) for < $0.80 so why bother?

correct me if i am wrong about all disks/controllers accessing tracks above 80... (anecdotal: i have a brand new ds/dd floppy i got from atari directly which won't go in either 1040 or mega4 since it has the connections "reversed" and the power cable/ribbon cable are not long enough to "flip"...how's THAT for compatibility!).

From: alderaan@tubopal.UUCP
Message-ID: <652@opal.tubopal.UUCP>
Source record: 248952

What's all this about MultiTasking on the ST ? You don't have a MMU (not really and I think that's the worst failure in the ST's hardware architechture), so you are definetely not able to run a *secure* multitasking on this machine even if you want to - basta. All what you can call protected memory inside the ST is a bunch of bytes at the bottom plus the hardware registers - that's it. If you want to realize reasonable memory segmentation (in my experience this is essential for TimeSharing) you MUST have a MMU.

>
> Mark Newton-John

Yes, the PS3000 was a limited-production thing. It was, as you describe, a single-sided drive built in to an RGB color monitor. A few were made, they were not particularly successful, and production was stopped. If you really want one, you may be able to find a dealer who still has one, but it has been quite a while since Atari has shipped any.

Hope that's helpful.

Subject: DeskJets and Atari Parallel Port
To: info-atari16@score.stanford.edu

I have been conspicuously silent with respect to the Atari ST parallel port
current sink limit and DeskJet/DeskJet+ pullup resistors.
You see, here's my dilema: The Atari ST is not officially
```

supported for use with the DeskJet printers. This means we have not
tested the printer and our support people will be next to useless in
resolving problems. They won't tell you to "take a hike, its not supported",
rather our support people simply lack Atari expertise to help with any
significant technical problems.

Furthermore, I am unable to test and verify any of the proposed solutions
to the current limit problem. Using the 7407 buffer on the data and strobe
lines should work fine, but as an HP representative I cannot say this is the
"HP recommended" solution. You also could use the serial port at 19.2 K
baud (in most cases this will not hurt performance) but I have been told
by Atari users there are various gotchas when trying to print out the
serial port. I still fail to understand how the DeskJet+ could damage
an Atari, even though there is one case of anecdotal evidence to the
contrary. The current limit could result in marginal logic levels
on data and especially strobe, but if the Atari can only sink 1.6ma
thats fine, and if the printer tries to draw more the Atari simply cannot
supply it -- how can this damage the Atari? If I had an Atari I would
definately buffer the parallel port with the 7407 for logic level
reliability if nothing else.

If you have sent me mail about this problem and I haven't answered
I'm sorry and I hope this posting explains the situation somewhat.
I hope this posting is at least slightly better than nothing.

I have encouraged our support people to make a specific statement on
Atari support especially relating to the current limit on the parallel
port but so far they have not come up with an official position.

Subject: Re: DeskJets and Atari Parallel Port
To: info-atari16@score.stanford.edu

I have built a cable with the 7407s and use the Tools TeX driver
with no problems, no problems about turning on the computer and
printer in various orders either.

I do have one question, some hp laserjet drivers work and some don't.
My observation: Is it the case that the drivers that work have the
computer do "everything" while those that don't
want to download fonts to the printer? When attempting
to print TeX with a driver that doesn't work the
built in printer fonts are used
and so a mess is created.

QuickST 1.5 has fixed almost all of the vt52 terminal emulation
descrepencies, except for that of setting colors (doesn't recognize
the codes, prints garbage) This renders it unusable for me.

Subject: TeX on Atari ST
To: INFO-ATARI16@SCORE.STANFORD.EDU

Hello!

I want to tell you something about a new Sharware Programm for the
Atari ST. It's called TeX and might be known by everybody. TeX was developed
by E. Knuth in over 10 years hard work. It was written in WEB, a kind of
mega pascal language which is not computer-orientated.
So it was possible to transfirm TeX to "every" kind of computer, also
on the Atari ST.

But what is TeX. I thing some of you know Signum!2 from
Application Systems Heidelberg. TeX is Signum!2 times Signum!2. TeX is a
program that brings your words in the right form, makes for you a
table of contents automatically and footnotes are no more a problem.
But the best of all is the possibility of TeX to make your equation look
like in a book. For example:
You type in: $(x+y)=xc2+2xy+yc2$ and the result is ...
(Sorry, but the monitor can't show you.)

TeX is like a programming language. You have if-cases and so on.
So you want to know something about TeX? Here is a little literature-list:

-for german users: Helmut Kopka; LaTeX, eine Einfuehrung; Addison-
Wesley Publishing Company; Bonn 2. Auflage 1989
(very good, easy to understand, to get results)
-for everyone: D. E. Knuth; The TeXbook; Addison-Wesley P. C.; 1984
(the original, to know everything about TeX)

L. Lamport; A Document Preparation System; A.-W. P. C.
(written by the author of LaTeX, good but I prefare
H. Kopka)

TeX knows all features you need to write a nice letter, your works and
everything else. Another helpful thing ist that you can write your
TeX-text on an editor by your choice. TeX-inputfiles are always
ASCII-Files. So you can copy some files from your VMS- or SUN-machine
and work with it at home (but the up-side-down way is quite more
interesting, because of the possibility to use the laser-printer
of your university and so on).

But what's the new on this 5th version of TeX on Atari ST computers?

Really easy to understand, when I tell you that it is translated into
Turbo-C and compiled. This version is much more faster than the other
and not so expensive because it is shareware.

The price for this TeX-version incl. a shell, a screen- and a print-
previewer, fonts, a short-instruction and several style-files (you need
them to write a book, article, report, letter, descriptions,...), LaTeX

and the 'german-language-file',... is 20 Deutsche Marks for a unregistrated version and 60 Deutsche Mark for a registrated version. The registrated version incl. one backup and a note for every following backups and online-telephone-help for your problems. The package incl. 3 disks packed by ARC (ARC is incl.; makes something about 6 Deutsche Marks for one disk).

And where can you get that really good stuff??

Stefan Lindner
Iltisstrasse 3
8510 Fuerth
West Germany

(if you don't live in West German call Mr. Lindner first, because of the price!)

If you order a version please note, that the price above is the price for orders in West Germany, other lands have different prices because of the post costs.

If you order a version please write a note that you got the information from like this:

"Informations about this TeX version by Udo Heinrich, #00091!"

If you want some more informations send OONNEE SSMMAALL note to me.

Hope the information was useful

Udo Heinrich

To: info-atari16@score.stanford.edu

Hello, I just got a spreadsheet program off the net. Maybe you too have seen it, its called Opus and it seems to be just the thing I have been looking for. But, alas, there is one small problem. In order to do charting from the program one has to have GDOS. Well, I thought, I'll just pull the GDOS stuff off my DEGAS disk and use it here. No, that didn't work.
To make a long story short, if that is still possible, does anybody out there have any idea how to get this damn thing to work. I sure haven't figured it out yet.
You can either mail me a reply, or post your response here. Makes no diff to me.
Thanks in advance.

I wonder why you would want to do a cold boot in GFA-basic, but I think
this will do it:

```
Slpoke &H420,0 ! Clear Memvalid (makes next boot COLD)
Void Gemdos(32,L:0) ! Go in to supervisor mode
' you can void the result, since there is
' no return form a reset
Reset%=Lpeek(4) ! Get reset vector
Call Reset% ! Jump there
```

| too much. The info in the file does not look too bad.

I'm sorry, but that fold info looked pretty nasty to me. I really like
the way Todd has implemented the folding, using separate files. I imagine
this scheme must make the relational features of FOLDED easier to implement
as well (and thus, easier for us to hack on! ;-).

Your points about speed are right on, though - FOLDED could use quite a bit
of optimizing. As you mentioned, though, Todd does explain in the

documentation that it was brought up to be small and functional, and not necessarily a speed demon.

One thing I really like is the way the screen redraws (from the line you're on outwards). But I too wish that it didn't redraw quite so much ;-).

> know you shipped today?" "You don't, and I don't care if you don't believe
> me." Hmmph!

Mr Vederman was never intentionally misled -- we would have nothing to gain by doing so. For our part in the confusion we apologize. There was a delay in shipping the boards and for that I also apologize. We all did everything we could to get the product out on schedule, and I think it is safe to say we were just as anxious to get it out as anyone was to receive it, if not much more so. But we are human, and I am very sorry about any inconvenience the delay caused anyone. The boards, are now shipping, and have been for a couple of weeks.

> Friday rolls around, and after a delay from UPS, I got the board. Looks nice,

> installation? No answer in the manual. Trial and error, showed that they
> were not needed.

Actually, there are instructions for installing our product in an ST with the processor removed, and they are different from the piggy-back method and there are some fly-wires necessary. Mr Vederman went on to say that that neither his disk drive nor his hard disk would work with our board. This is cause he didn't put in the fly-wires as instructed in the manual.

We did our best to make the manual clear and understandable, but we're human. I don't believe it's possible to make the manual clear and concise, and answer everyone's questions. That's why we have a full time customer service person. I've found Lilliane to be quite conscientious in helping customers with their problems. Installing our board, or in fact any product inside an ST, is not for the fainthearted. Unless they are comfortable with both circuit boards and soldering irons, we recommend our customers have their dealers install our product.

Starting today, for people who buy an accelerator directly from us and send their computer into us, we will install our board for free. For those who break their ST trying to install our board themselves, we'll fix it for a flat $50, including return shipping.

Mr. Vederman did call us, and Lilliane explained his trouble over the phone. And he got his board working. However, he wasn't able to get FAST-ROM to work for reasons we weren't able to determine over the phone. (The problem may well have been a defective part on our board. We do fully test all of our boards before we ship them, but still a small percentage fail in the field.) We offered to fix his machine with our board in it if he sent it to us (he didn't want to do this because he didn't want to lose the use of his computer -- quite understandable), or to send him a new board, or to refund his money. He chose the latter. Of course we are disappointed and are confident a new board would have solved his problem, but it was his choice. We've never had any allusions that we could please everyone.

> Point of story: I have a $300 paper weight.

No one is ever stuck with one our products. Within 15 days of getting any of our products, it may be returned for an reason for a full refund. And all of our products also carry a six month warranty. We guarantee our products to work and will do what ever it takes to see that they do, or refund the customers money.

Timeline, Inc, 1-800-872-8878 will sell you an adaptec 4000a for $60.
Even the others sell it for $135.

Get the 4070 ONLY if your going to put an RLL drive into your sh204.

I recommend getting a 4000a, and adding an outboarded second drive.

>there are at least 10 shops in the Tottenham Court Road area (including
>Silica Shop/Systems and the Virgin Games Store)!

Note that as the last time I was in London (for the Atari User Show)
Virgin Games Store had stopped stocking computer games. They had been
moved to a spot in the Virgin Megastore on Oxford Street nearer
Tottenham Court Road. It also looked like the range they stocked had
gotten smaller, but maybe that's just because the Megastore is so much
bigger than the Games Store. The advantage to the move is that it is
MUCH easier to find the Megastore than the Games Store. The disadvantage
is that once you're in the Megastore, it's painfully difficult to find
the computer games bit.

Silica Shop is also tricky to find. It's upstairs in a building named
'Lion House', at 227 Tottenham Court Road. Go in the main door, and up
the (probably not-running) escalator.

From: mcvax!ukc!icdoc!syma!lezo@uunet.uu.net (Lez Oxley)
Subject: Cumana External Drive Problem : Or is it?
To: info-atari16@score.stanford.edu

I have just noticed what I think are problems with my Cumana CSA 354
1 Meg Disk Drive which I use as external drive B. It is only 3 months
old and is connected to a 'standard' 3 year-old 1040ST with 'old' TOS in
rom. The problem occurs intermittently in all screen resolutions. Can
anyone offer any help/advice which does not involve taking things to
bits! The symptoms are as follows:

1. Used as a drive for reading only the drive seems to be OK.

2. Random seek tests and speed tests seem to be OK.

3. When used for writing to, single one-off file transfers seem to be OK.
(eg. saving a WP document or program source very 20 minutes or so.)

4. When used for writing to, involving disk to disk copying (Drive A: to
Drive B:) sometimes the internal drive can't read the disk so
produced and neither can any other Atari Disk Drive. Sometimes the
Cumana drive itself can not consistently read its own disk, ie.
sometimes it refuses to read what it has written, ten minutes later,
however, it may read it (after rebooting disk swapping etc).

5. When used for writing to, by copying (say) 30 files from drive A:
some of the 30 files seem to get corrupted. The 'directory' entries
look OK - files sizes OK, etc. but when you list an ASCII file (eg)
you sometimes get garbage in the file instead on the real data.
Program files are corrupted in a similiar way and either they time
bomb out or chunks of code don't work. Unlike 4. the Cumana drive is
never able read the corruption.

6. I have used George Woodside's VKILLER to check for a virus and
nothing's shown up. (I get the problem when I boot up from a wide
range of disks.)

7. The same problem occurs on different media - cheap disks, SONY disks,
Memorex disks, Verbatim, . . .

8. I am not using lots of folders - no more than 10 in a session.

Has anyone got any ideas as to what may be going wrong - I always
thought that TOS verified everything it wrote to a disk (an annoyance
to some people I know)?

Are there any nifty disk checking utilities out there? If so can someone
mail me a disk checker or even a byte-by-byte file comparision program
so that I can reverify files written on the Cumana?

Any help will be gratefully received. Sorry to have gone on at such
length but I felt I had to supply as much information on the problem as
possible - this is my first posting to the net.

(For all I know the drive may have been faulty at birth or got crunched
slightly coping with all that horrible copy protection which makes your
disk drive sound more like a coffee grinder.)

I don't know of any around, but that may be because you don't need one. Just
copy the files (not the whole disk, the files) to another (empty) floppy, and
they will be made contiguous. If you have a big enough RAMdisk, you can copy
the files to it, delete them from the original floppy, then copy them back.

When you use the desktop (or most utility programs) to copy whole disks, the
structure (and consequent fragmentation) of the disk is maintained. When
you copy the files (or complete folders), the data is accessed as a file,
and read and written back as file-sized entities. If the destination is
blank, the files are written contiguously.

Depending upon which software you are running, there are usually hooks
in the auto boot code to allow you to prevent an auto boot whenever you want.

Check the documentation from the vendor of your driver.

The more common ones are holding down a shift key, the Alt key, the
Control key, or some combination of them when powering up your system.

Most bypass techniques are effective only at power up, not at reset.

>
>Why not trash the GEM stuff and the Turtle Logo. I guess that would give you
>more memory. If a program is run as a '.prg' then you can still use the mouse
>via the Line-A routines & variables.

Because that's not the program where the more severe memory constraint is.
"TURTLE.PRG" is the GEM front end. It has the menus, mouse, etc. It does all
the user interface work, and builds a command line for the other program.
"TTLEXEC.TTP" is the program that does the backup work. It has to fit into
memory with the RAMdisk, and that's the one that's squeezed to the max.

The two programs trigger each other via shel_exec, so they have to be
kept the same size in order to fit into the same memory space, once
the RAMdisk is activated.

Since the majority of ST users are not software hackers, I resist the
temptation to implement any non-standard interface techniques. Part of
the elegance of the ST is that, by having GEM built in, it provides
a platform which offers the same user interface across a wide scope of
programs. Given years of remembering obscure control-key commands and
wierd letter-options from CP/M, MS-DOS, and UNIX, I find menus and
clearly explained options in dialog boxes a real pleasure. Point and
click is the next best thing to audible commands, in my opinion.

Subject: DeskJets and Atari Parallel Port
To: info-atari16@score.stanford.edu

I have been conspicuously silent with respect to the Atari ST parallel port
current sink limit and DeskJet/DeskJet+ pullup resistors.
You see, here's my dilema: The Atari ST is not officially
supported for use with the DeskJet printers. This means we have not
```

tested the printer and our support people will be next to useless in resolving problems. They won't tell you to "take a hike, its not supported", rather our support people simply lack Atari expertise to help with any significant technical problems.

Furthermore, I am unable to test and verify any of the proposed solutions to the current limit problem. Using the 7407 buffer on the data and strobe lines should work fine, but as an HP representative I cannot say this is the "HP recommended" solution. You also could use the serial port at 19.2 K baud (in most cases this will not hurt performance) but I have been told by Atari users there are various gotchas when trying to print out the serial port. I still fail to understand how the DeskJet+ could damage an Atari, even though there is one case of anecdotal evidence to the contrary. The current limit could result in marginal logic levels on data and especially strobe, but if the Atari can only sink 1.6ma thats fine, and if the printer tries to draw more the Atari simply cannot supply it -- how can this damage the Atari? If I had an Atari I would definately buffer the parallel port with the 7407 for logic level reliability if nothing else.

If you have sent me mail about this problem and I haven't answered I'm sorry and I hope this posting explains the situation somewhat. I hope this posting is at least slightly better than nothing.

I have encouraged our support people to make a specific statement on Atari support especially relating to the current limit on the parallel port but so far they have not come up with an official position.

Subject: Re: DeskJets and Atari Parallel Port
To: info-atari16@score.stanford.edu

I have built a cable with the 7407s and use the Tools TeX driver with no problems, no problems about turning on the computer and

printer in various orders either.

I do have one question, some hp laserjet drivers work and some don't.
My observation: Is it the case that the drivers that work have the
computer do "everything" while those that don't
want to download fonts to the printer? When attempting
to print TeX with a driver that doesn't work the
built in printer fonts are used
and so a mess is created.

From: Udo Heinrich <OR160%DBNUOR1.BITNET@Forsythe.Stanford.EDU>
Subject: TeX on Atari ST
To: INFO-ATARI16@SCORE.STANFORD.EDU

Hello!

I want to tell you something about a new Sharware Programm for the
Atari ST. It's called TeX and might be known by everybody. TeX was developed
by E. Knuth in over 10 years hard work. It was written in WEB, a kind of
mega pascal language which is not computer-orientated.
So it was possible to transfirm TeX to "every" kind of computer, also
on the Atari ST.

But what is TeX. I thing some of you know Signum!2 from
Application Systems Heidelberg. TeX is Signum!2 times Signum!2. TeX is a
program that brings your words in the right form, makes for you a
table of contents automatically and footnotes are no more a problem.
But the best of all is the possibility of TeX to make your equation look
like in a book. For example:
You type in: $(x+y)=xc2+2xy+yc2$ and the result is ...
(Sorry, but the monitor can't show you.)

TeX is like a programming language. You have if-cases and so on.
So you want to know something about TeX? Here is a little literature-list:

-for german users: Helmut Kopka; LaTeX, eine Einfuehrung; Addison-
Wesley Publishing Company; Bonn 2. Auflage 1989
(very good, easy to understand, to get results)
-for everyone: D. E. Knuth; The TeXbook; Addison-Wesley P. C.; 1984
(the original, to know everything about TeX)

L. Lamport; A Document Preparation System; A.-W. P. C.
(written by the author of LaTeX, good but I prefare
H. Kopka)

TeX knows all features you need to write a nice letter, your works and
everything else. Another helpful thing ist that you can write your
TeX-text on an editor by your choice. TeX-inputfiles are always
ASCII-Files. So you can copy some files from your VMS- or SUN-machine
and work with it at home (but the up-side-down way is quite more
interesting, because of the possibility to use the laser-printer
of your university and so on).

But what's the new on this 5th version of TeX on Atari ST computers?

Really easy to understand, when I tell you that it is translated into
Turbo-C and compiled. This version is much more faster than the other
and not so expensive because it is shareware.

The price for this TeX-version incl. a shell, a screen- and a print-
previewer, fonts, a short-instruction and several style-files (you need
them to write a book, article, report, letter, descriptions,...), LaTeX
and the 'german-language-file',... is 20 Deutsche Marks for a unregistrated

version and 60 Deutsche Mark for a registrated version. The registrated version
incl. one backup and a note for every following backups and
online-telephone-help for your problems. The package incl. 3 disks
packed by ARC (ARC is incl.; makes something about 6 Deutsche Marks for
one disk).

And where can you get that really good stuff??

Stefan Lindner
Iltisstrasse 3
8510 Fuerth
West Germany

(if you don't live in West German call Mr. Lindner first, because of
the price!)

If you order a version please note, that the price above is the price
for orders in West Germany, other lands have different prices because
of the post costs.

If you order a version please write a note that you got the information
from like this:

"Informations about this TeX version by Udo Heinrich, #00091!"

If you want some more informations send OONNEE SSMMAALL note to me.

Hope the information was useful

Udo Heinrich

I wonder why you would want to do a cold boot in GFA-basic, but I think
this will do it:

```
Slpoke &H420,0 ! Clear Memvalid (makes next boot COLD)
Void Gemdos(32,L:0) ! Go in to supervisor mode
' you can void the result, since there is
' no return form a reset
Reset%=Lpeek(4) ! Get reset vector
Call Reset% ! Jump there
```

| too much. The info in the file does not look too bad.

I'm sorry, but that fold info looked pretty nasty to me. I really like
the way Todd has implemented the folding, using separate files. I imagine
this scheme must make the relational features of FOLDED easier to implement
as well (and thus, easier for us to hack on! ;-).

Your points about speed are right on, though - FOLDED could use quite a bit
of optimizing. As you mentioned, though, Todd does explain in the

documentation that it was brought up to be small and functional, and not necessarily a speed demon.

One thing I really like is the way the screen redraws (from the line you're on outwards). But I too wish that it didn't redraw quite so much ;-).

> me." Hmmph!

Mr Vederman was never intentionally misled -- we would have nothing to gain by doing so. For our part in the confusion we apologize. There was a delay in shipping the boards and for that I also apologize. We all did everything we could to get the product out on schedule, and I think it is safe to say we were just as anxious to get it out as anyone was to receive it, if not much more so. But we are human, and I am very sorry about any inconvenience the delay caused anyone. The boards, are now shipping, and have been for a couple of weeks.

> Friday rolls around, and after a delay from UPS, I got the board. Looks nice,

> "fly-wires" to connect the board to the ST. Do I need this for the socket
> installation? No answer in the manual. Trial and error, showed that they
> were not needed.

Actually, there are instructions for installing our product in an ST with the processor removed, and they are different from the piggy-back method and there are some fly-wires necessary. Mr Vederman went on to say that that neither his disk drive nor his hard disk would work with our board. This is cause he didn't put in the fly-wires as instructed in the manual.

We did our best to make the manual clear and understandable, but we're human. I don't believe it's possible to make the manual clear and concise, and answer everyone's questions. That's why we have a full time customer service person. I've found Lilliane to be quite conscientious in helping customers with their problems. Installing our board, or in fact any product inside an ST, is not for the fainthearted. Unless they are comfortable with both circuit boards and soldering irons, we recommend our customers have their dealers install our product.

Starting today, for people who buy an accelerator directly from us and send their computer into us, we will install our board for free. For those who break their ST trying to install our board themselves, we'll fix it for a flat $50, including return shipping.

Mr. Vederman did call us, and Lilliane explained his trouble over the phone. And he got his board working. However, he wasn't able to get FAST-ROM to work for reasons we weren't able to determine over the phone. (The problem may well have been a defective part on our board. We do fully test all of our boards before we ship them, but still a small percentage fail in the field.) We offered to fix his machine with our board in it if he sent it to us (he didn't want to do this because he didn't want to lose the use of his computer -- quite understandable), or to send him a new board, or to refund his money. He chose the latter. Of course we are disappointed and are confident a new board would have solved his problem, but it was his choice. We've never had any allusions that we could please everyone.

> Point of story: I have a $300 paper weight.

No one is ever stuck with one our products. Within 15 days of getting any of our products, it may be returned for an reason for a full refund. And all of our products also carry a six month warranty. We guarantee our products to work and will do what ever it takes to see that they do, or refund the customers money.

Timeline, Inc, 1-800-872-8878 will sell you an adaptec 4000a for $60.
Even the others sell it for $135.

Get the 4070 ONLY if your going to put an RLL drive into your sh204.

I recommend getting a 4000a, and adding an outboarded second drive.

>there are at least 10 shops in the Tottenham Court Road area (including
>Silica Shop/Systems and the Virgin Games Store)!

Note that as the last time I was in London (for the Atari User Show)
Virgin Games Store had stopped stocking computer games. They had been
moved to a spot in the Virgin Megastore on Oxford Street nearer
Tottenham Court Road. It also looked like the range they stocked had
gotten smaller, but maybe that's just because the Megastore is so much
bigger than the Games Store. The advantage to the move is that it is
MUCH easier to find the Megastore than the Games Store. The disadvantage
is that once you're in the Megastore, it's painfully difficult to find
the computer games bit.

Silica Shop is also tricky to find. It's upstairs in a building named
'Lion House', at 227 Tottenham Court Road. Go in the main door, and up
the (probably not-running) escalator.

Subject: Cumana External Drive Problem : Or is it?
To: info-atari16@score.stanford.edu

I have just noticed what I think are problems with my Cumana CSA 354
1 Meg Disk Drive which I use as external drive B. It is only 3 months
old and is connected to a 'standard' 3 year-old 1040ST with 'old' TOS in
rom. The problem occurs intermittently in all screen resolutions. Can
anyone offer any help/advice which does not involve taking things to
bits! The symptoms are as follows:

1. Used as a drive for reading only the drive seems to be OK.

2. Random seek tests and speed tests seem to be OK.

3. When used for writing to, single one-off file transfers seem to be OK.
(eg. saving a WP document or program source very 20 minutes or so.)

4. When used for writing to, involving disk to disk copying (Drive A: to
Drive B:) sometimes the internal drive can't read the disk so
produced and neither can any other Atari Disk Drive. Sometimes the
Cumana drive itself can not consistently read its own disk, ie.
sometimes it refuses to read what it has written, ten minutes later,
however, it may read it (after rebooting disk swapping etc).

5. When used for writing to, by copying (say) 30 files from drive A:
some of the 30 files seem to get corrupted. The 'directory' entries
look OK - files sizes OK, etc. but when you list an ASCII file (eg)
you sometimes get garbage in the file instead on the real data.
Program files are corrupted in a similiar way and either they time
bomb out or chunks of code don't work. Unlike 4. the Cumana drive is
never able read the corruption.

6. I have used George Woodside's VKILLER to check for a virus and
nothing's shown up. (I get the problem when I boot up from a wide
range of disks.)

7. The same problem occurs on different media - cheap disks, SONY disks,
Memorex disks, Verbatim, . . .

8. I am not using lots of folders - no more than 10 in a session.

Has anyone got any ideas as to what may be going wrong - I always
thought that TOS verified everything it wrote to a disk (an annoyance
to some people I know)?

Are there any nifty disk checking utilities out there? If so can someone
mail me a disk checker or even a byte-by-byte file comparision program
so that I can reverify files written on the Cumana?

Any help will be gratefully received. Sorry to have gone on at such
length but I felt I had to supply as much information on the problem as
possible - this is my first posting to the net.

(For all I know the drive may have been faulty at birth or got crunched
slightly coping with all that horrible copy protection which makes your
disk drive sound more like a coffee grinder.)

~~HELP !
~~I seem to get extra \r's from putchar()!!!! (or getchar()?)
~
~On the ST, the end-of-line code is \r\n, not just \n as it is on UNIX.
~In order to output valid text files, C libraries translate \n to \r\n
~on output, and back the other way on input.
~
~Most C compilers on the ST let you pass a "b" modifier to in the second
~parameter of fopen(); this tells the compiler to skip its I/O translation.
~ ...
~Hope that helps.
~
~sgrimm@sun.com ...!sun!sgrimm

Actually I am not getting the \r\n pair just the \r and somewhat
randomly sprinkled throughout the file.

A la UN*X I planned to use the splay program as a filter using
stdin and stdout. Maybe I can write a scratch file fopen'd as
per your sugesstion and then cat the scratch file to stdout via
Pexec or execvec().

Thanks for the reply.

I don't know of any around, but that may be because you don't need one. Just copy the files (not the whole disk, the files) to another (empty) floppy, and they will be made contiguous. If you have a big enough RAMdisk, you can copy the files to it, delete them from the original floppy, then copy them back.

When you use the desktop (or most utility programs) to copy whole disks, the structure (and consequent fragmentation) of the disk is maintained. When you copy the files (or complete folders), the data is accessed as a file, and read and written back as file-sized entities. If the destination is blank, the files are written contiguously.

>
>What now? Does anyone have a similar program that works on tos1.4???

Depending upon which software you are running, there are usually hooks in the auto boot code to allow you to prevent an auto boot whenever you want.

Check the documentation from the vendor of your driver.

The more common ones are holding down a shift key, the Alt key, the
Control key, or some combination of them when powering up your system.

Most bypass techniques are effective only at power up, not at reset.

>
>Why not trash the GEM stuff and the Turtle Logo. I guess that would give you
>more memory. If a program is run as a '.prg' then you can still use the mouse
>via the Line-A routines & variables.

Because that's not the program where the more severe memory constraint is.
"TURTLE.PRG" is the GEM front end. It has the menus, mouse, etc. It does all
the user interface work, and builds a command line for the other program.
"TTLEXEC.TTP" is the program that does the backup work. It has to fit into
memory with the RAMdisk, and that's the one that's squeezed to the max.

The two programs trigger each other via shel_exec, so they have to be
kept the same size in order to fit into the same memory space, once
the RAMdisk is activated.

Since the majority of ST users are not software hackers, I resist the
temptation to implement any non-standard interface techniques. Part of
the elegance of the ST is that, by having GEM built in, it provides
a platform which offers the same user interface across a wide scope of
programs. Given years of remembering obscure control-key commands and
wierd letter-options from CP/M, MS-DOS, and UNIX, I find menus and
clearly explained options in dialog boxes a real pleasure. Point and
click is the next best thing to audible commands, in my opinion.

We didn't receive all of GNU EMACS for the ST here at gtephx
as well. Also, are the source code files for the ST version of GNU EMACS
available?? And was GNU EMACS GEMized for the ST (adding things like a
file selector would be nice!!).

So, please email me the binaries and/or the source code to GNU
EMACS for the ST.

TIA

I don't know of any around, but that may be because you don't need one. Just copy the files (not the whole disk, the files) to another (empty) floppy, and they will be made contiguous. If you have a big enough RAMdisk, you can copy the files to it, delete them from the original floppy, then copy them back.

When you use the desktop (or most utility programs) to copy whole disks, the structure (and consequent fragmentation) of the disk is maintained. When you copy the files (or complete folders), the data is accessed as a file, and read and written back as file-sized entities. If the destination is blank, the files are written contiguously.

>
>What now? Does anyone have a similar program that works on tos1.4???

Depending upon which software you are running, there are usually hooks in the auto boot code to allow you to prevent an auto boot whenever you want.

Check the documentation from the vendor of your driver.

The more common ones are holding down a shift key, the Alt key, the
Control key, or some combination of them when powering up your system.

Most bypass techniques are effective only at power up, not at reset.

>
>Why not trash the GEM stuff and the Turtle Logo. I guess that would give you
>more memory. If a program is run as a '.prg' then you can still use the mouse
>via the Line-A routines & variables.

Because that's not the program where the more severe memory constraint is.
"TURTLE.PRG" is the GEM front end. It has the menus, mouse, etc. It does all
the user interface work, and builds a command line for the other program.
"TTLEXEC.TTP" is the program that does the backup work. It has to fit into
memory with the RAMdisk, and that's the one that's squeezed to the max.

The two programs trigger each other via shel_exec, so they have to be
kept the same size in order to fit into the same memory space, once
the RAMdisk is activated.

Since the majority of ST users are not software hackers, I resist the
temptation to implement any non-standard interface techniques. Part of
the elegance of the ST is that, by having GEM built in, it provides
a platform which offers the same user interface across a wide scope of
programs. Given years of remembering obscure control-key commands and
wierd letter-options from CP/M, MS-DOS, and UNIX, I find menus and
clearly explained options in dialog boxes a real pleasure. Point and
click is the next best thing to audible commands, in my opinion.

Subject: DVT VCR Hard Drive backup
To: Atari Newsgroup <INFO-ATARI16@SCORE.STANFORD.EDU>

I received my DVT VCR HD Backup device and software yesterday.
I ordered it from Computability as advertised in START for $209.00
Currently the software only supports file backup, no image backup,
though the software could easily support it. In START it's advertised
is as storing 8 megabits/minute which would be 1 megabyte/minute right?
I backedup my 'C' partition which contained c12meg of files and it took
35 minutes, which would average out to 333K/minute right? They also
advertised that it stores up to 360 megabytes (per tape I'm assuming).
Using a 120 minute tape, I will only be able to store c48Megabytes/tape.
They must have been using one big tape. They suggest using SP mode,
which is the fastest playing mode (i.e. record 2 hours/tape). For
$209 I guess I got my money's worth, I just hope they come out with
an image backup utility.

I know, we were told not to expect much from GNU EMACS with only 1 Meg, but
after determining that it only used about 300 K text+data+bss I gave it a
shot. Just start it, read some stuff in and push a few keys, nothing serious.
Impressive hardly describes it. Looks just like on the VAX, only it starts
up faster. But I have a couple of ???-s.
The start-up seems to crash rather than finishing normally (something about
invalid argument stringp null, as I remember). Control Z gives a kind of
no-op (the bottom line flashes 'program terminated' ever so briefly, then
I'm back in EMACS. And dired seems to be getting confused, probably by the
$HOME environment variable in \ form (rather than / form) which is really
there for the use of the shell, msh, rather than EMACS.
But the program runs fast, and there's a tremendous amount there. This is
going to be fun to explore.
I hope the diffs from a widely available source distribution show up on
the net.

Aaagh!
Is it just my imagination, or does 10% of the mail in this group really consist of requests for details of piggy back expansions?
Perhaps if I reply, they might desist?

OK peeps, you asked for it..

First off get hold of 16 DRAMs in Dual In Line packages. These look like the ones already fitted along the front right of your ST, if in doubt, quote the section of the device marking which includes the number 256, and ask for an equivalent part. There are far too many to list them all, but basic specs are : 256K x 1 page mode DRAM, 150 nanoseconds or faster, preferably in plastic package (cheaper!), 16 pin DIL outline.
They're not cheap, and prices vary enormously, so shop around.

Each chip has a notch at one end, to show which way up it is fitted. With the notch uppermost, pin 1 is to the left of the notch, pin 8 is at bottom left, pin 9 bottom right, and pin 16 top right. Armed with this information, find pins 4 and 15 on each of your new chips in turn, and bend them CAREFULLY through 180 degrees without breaking them off. Bend them as close to the body of the chip as you can. These are the RAS and CAS pins which work as chip select lines. The chips will normally be supplied in black anti-static foam. Try to keep them there while you bend the pins.

Now, one at a time, sit a new chip on top of one of the built-in DRAMs, with the notch at the same end (!!) and solder each of the other 14 pairs of pins together. Make sure the chips are accurately lined up, use only the minimum of fine multicore solder, and watch out for 'bridges' of solder between adjacent pairs of pins, and solder splashes on the PCB. This takes care of all the address, data, power, and read/write_ lines.

Lastly, locate the MMU chip. This is a square, 68 pin device, U15 on early machines, and probably the one nearest the DRAMs on all versions. This has a pip in the middle of one side to indicate pins 1 & 68.
From the top of the board, they are numbered anticlockwise. Attach one end of a short (300mm or so) length of thin INSULATED wire to each of pins 18 (RAS1), 21 (CAS1LOW), and 22 (CAS1HIGH). Prototyping wire is ideal, particularly the "solder-wrap" type sold in the UK as "Verowire" (R) for around 5.5 pounds. Don't connect directly to the MMU, take the wires through a suitable hole, and trace the pins to the underside of the PCB.
The wire from RAS1 should be soldered to pin 4 of ALL the new DRAMs. If you are skilled enough to do it, a 33 ohm Resistor should be used in series as near to the MMU as possible to dampen reflections on all 3 of these wires, but its omission is unlikely to cause problems.
The wire from CAS1LOW should be soldered to pin 15 of the LEFTmost 8 new DRAMs, and that from CAS1HIGH to the RIGHTmost 8.

That's it. Depending on your confidence and proficiency, it should take about half to 2 hours. DO try to do it all in one session, and avoid touching the chips as much as possible, they are static sensitive.
A use ful tip - DISCONNECT the power supply, and attach a lead from the ground rail around the edge of the board to your metal watch strap. keep the chips in their foam sitting on a bare area of the ground rail. I'ts not a static safe workstation, but it's as near as most of you will get.

If you have a hard disk, unhook it before you first try out your handiwork! If it doesn't work : don't blame me! If your ST runs, but still only with 0.5 MB, check for unsoldered pins, suspect duff chip(s). If it goes crazy, check for solder shorts, check correct pins used on MMU, take it to your nearest hardware wiz with a print of these 'destructions'.

Finally, piggybacking 1Mbit DRAMs instead of 256K for 2.5Mbytes :
This is MESSY, the pinouts don't match up well, and several pins need to be bent through impossible angles. You will need to connect another flying lead for the extra address from MMU pin 64 to A9 on ALL the 1M drams.
Again the 33 ohm resistor aught to be included as before.
The relevent pinouts follow, I won't go into more detail as I hold the view that if you can't figure it out from here, you shouldn't attempt to do it. A useful hint though, apart (perhaps) from A9 (for refresh considerations), the address pin numbers can be swapped around anyhow you like, ie A0 can be used as A1 etc..

Viewed from above:

256K DRAM pinout 1M DRAM pinout

notch notch
1 A8 16 Vss 1 Data in 18 Vss
2 Data in 15 CAS_ 2 Write_ 17 Data out
3 Write_ 14 Data out 3 RAS_ 16 CAS_
4 RAS_ 13 A6 4 UNUSED 15 A9
5 A0 12 A3 5 A0 14 A8
6 A2 11 A4 6 A1 13 A7
7 A1 10 A5 7 A2 12 A6
8 Vcc 9 A7 8 A3 11 A5
9 Vcc 10 A4

The above is submitted in good faith, but you use it at your own risk.
If you spot any mistakes, please post to this group first, flame me later!

Dave E.

This is speculative, but I haven't seen any other suggestions:

putchar and getchar are macros. They expand to putc(c,stdout) and getc(stdin), respectively. Both stdin and stdout are already opened as ASCII files when your program begins execution. The insertion of 0x0D into your data streams is most likely due to the high level handler attempting to add a carriage return (0x0D) when it sees a line feed (0x0A) in the stream.

You can eliminate this by opeing binary input and output files (use "rb" or "wb" as the second parameter in the fopen() call), and use the putc and getc calls directly with the appropriate file handle.

This is true. However, consider Professional Page (full Postscript color
seperations (4096 soon to be 16 mil)) and X-Cad. And remember you can run

both of them at the same time, and you can add an '030 to your system (A2000 without hacking) and a math co-processor (68882) and lots of good NTSC compatible video software available, and...

Don't kid yourself, this isn't an easy choice. I chose to go with the company with the least amount of vaporware...

> of resisters on the board, i'd hate to think that the speed is hard wired.
> Tell me is isn't so! (If it is, which one controls the speed?)

Most of the better 3.5" drives use a phase lock loop to control the drive RPM. They are supposed to be calibrated at the factory (the drive company's, not Atari's) and that is it. Most of them do not have any way to adjust the drive speed after they leave the factory. These are the best drives since they have very stable speeds. It takes a lot of extra drag (eg. pushing very hard on the disk media while spinning) to make them change RPM. But if they aren't correctly calibrated they

stink.

Atari has started using some less expensive drives, belt driven
instead of direct drive, most of them do have adjustments for the drive
speed.

You might try contacting the company that built the drive and
asking if (and how) the drive RPM can be adjusted. Depending on which
company you may or may not get any cooperation.

> There was a little magnet along with, i guess, a magnetic sensor. What is
> this for? (Is the drive speed, chip controled?)

That is probably the drive speed sensor for the PLL. If so then
there is probably nothing you can do to adjust the drive RPM.

Subject: Packed executables
To: info-atari16@score.stanford.edu

With respect to the recently posted pack/unpack programs posted to the binaries
group I have thought about a few problems that might result when packing
executables:-

* How does GEMDOS feel about loading a program with a header that does not
properly reflect the program that will be run? Even if the base-page is
set up accordingly, GEMDOS has seen the weird one first and may have already
set up some internal variables.

* Also when a program is loaded it is given the largest free area of memory.
If there is not enough memory Pexec returns an error. Programs that run
bigger than their header states will cause problems here (stack trampling,
screen corruption, bus errors etc).

* The unpacker that is glued on to the program will have to relocate the host
program itself. Possible future uses of the currently unused odd relocation
values will be lost here.

* It will also break if a TOS patch ever has to modify the program before
executing it.

Personally I am not happy with the idea. Compacting data files is fine and I
like it, but not executable programs.
I invite Atari themselves to to comment on this because they probably know of
even more horror stories that could result (and I can also ask them to post
the Pexec cookbook they promised us long ago).

Subject: DeskJets and Atari Parallel Port
To: info-atari16@score.stanford.edu

I have been conspicuously silent with respect to the Atari ST parallel port
current sink limit and DeskJet/DeskJet+ pullup resistors.
You see, here's my dilema: The Atari ST is not officially
supported for use with the DeskJet printers. This means we have not
```

tested the printer and our support people will be next to useless in resolving problems. They won't tell you to "take a hike, its not supported", rather our support people simply lack Atari expertise to help with any significant technical problems.

Furthermore, I am unable to test and verify any of the proposed solutions to the current limit problem. Using the 7407 buffer on the data and strobe lines should work fine, but as an HP representative I cannot say this is the "HP recommended" solution. You also could use the serial port at 19.2 K baud (in most cases this will not hurt performance) but I have been told by Atari users there are various gotchas when trying to print out the serial port. I still fail to understand how the DeskJet+ could damage an Atari, even though there is one case of anecdotal evidence to the contrary. The current limit could result in marginal logic levels on data and especially strobe, but if the Atari can only sink 1.6ma thats fine, and if the printer tries to draw more the Atari simply cannot supply it -- how can this damage the Atari? If I had an Atari I would definately buffer the parallel port with the 7407 for logic level reliability if nothing else.

If you have sent me mail about this problem and I haven't answered I'm sorry and I hope this posting explains the situation somewhat. I hope this posting is at least slightly better than nothing.

I have encouraged our support people to make a specific statement on Atari support especially relating to the current limit on the parallel port but so far they have not come up with an official position.

I have built a cable with the 7407s and use the Tools TeX driver with no problems, no problems about turning on the computer and

printer in various orders either.

I do have one question, some hp laserjet drivers work and some don't.
My observation: Is it the case that the drivers that work have the
computer do "everything" while those that don't
want to download fonts to the printer? When attempting
to print TeX with a driver that doesn't work the
built in printer fonts are used
and so a mess is created.

QuickST 1.5 has fixed almost all of the vt52 terminal emulation
descrepencies, except for that of setting colors (doesn't recognize
the codes, prints garbage) This renders it unusable for me.

Intensive testing of everything I could test intensively (I could still use
an industrial strength RAM test program) really didn't turn anything up. So
in desperation, I re-copied the hard disk driver into the auto folder on my
boot-up disk. No more problem. Go figure.

From: Udo Heinrich <OR160%DBNUOR1.BITNET@Forsythe.Stanford.EDU>
Subject: TeX on Atari ST
To: INFO-ATARI16@SCORE.STANFORD.EDU

Hello!

I want to tell you something about a new Sharware Programm for the
Atari ST. It's called TeX and might be known by everybody. TeX was developed
by E. Knuth in over 10 years hard work. It was written in WEB, a kind of
mega pascal language which is not computer-orientated.
So it was possible to transfirm TeX to "every" kind of computer, also
on the Atari ST.

But what is TeX. I thing some of you know Signum!2 from
Application Systems Heidelberg. TeX is Signum!2 times Signum!2. TeX is a
program that brings your words in the right form, makes for you a
table of contents automatically and footnotes are no more a problem.
But the best of all is the possibility of TeX to make your equation look
like in a book. For example:
You type in: $(x+y)=xc2+2xy+yc2$ and the result is ...
(Sorry, but the monitor can't show you.)

TeX is like a programming language. You have if-cases and so on.
So you want to know something about TeX? Here is a little literature-list:

-for german users: Helmut Kopka; LaTeX, eine Einfuehrung; Addison-
Wesley Publishing Company; Bonn 2. Auflage 1989
(very good, easy to understand, to get results)
-for everyone: D. E. Knuth; The TeXbook; Addison-Wesley P. C.; 1984
(the original, to know everything about TeX)

L. Lamport; A Document Preparation System; A.-W. P. C.
(written by the author of LaTeX, good but I prefare
H. Kopka)

TeX knows all features you need to write a nice letter, your works and
everything else. Another helpful thing ist that you can write your
TeX-text on an editor by your choice. TeX-inputfiles are always
ASCII-Files. So you can copy some files from your VMS- or SUN-machine
and work with it at home (but the up-side-down way is quite more
interesting, because of the possibility to use the laser-printer
of your university and so on).

But what's the new on this 5th version of TeX on Atari ST computers?

Really easy to understand, when I tell you that it is translated into
Turbo-C and compiled. This version is much more faster than the other
and not so expensive because it is shareware.

The price for this TeX-version incl. a shell, a screen- and a print-
previewer, fonts, a short-instruction and several style-files (you need
them to write a book, article, report, letter, descriptions,...), LaTeX
and the 'german-language-file',... is 20 Deutsche Marks for a unregistrated

version and 60 Deutsche Mark for a registrated version. The registrated version
incl. one backup and a note for every following backups and
online-telephone-help for your problems. The package incl. 3 disks
packed by ARC (ARC is incl.; makes something about 6 Deutsche Marks for
one disk).

And where can you get that really good stuff??

Stefan Lindner
Iltisstrasse 3
8510 Fuerth
West Germany

(if you don't live in West German call Mr. Lindner first, because of
the price!)

If you order a version please note, that the price above is the price
for orders in West Germany, other lands have different prices because
of the post costs.

If you order a version please write a note that you got the information
from like this:

"Informations about this TeX version by Udo Heinrich, #00091!"

If you want some more informations send OONNEE SSMMAALL note to me.

Hope the information was useful

Udo Heinrich

I wonder why you would want to do a cold boot in GFA-basic, but I think
this will do it:

```
Slpoke &H420,0 ! Clear Memvalid (makes next boot COLD)
Void Gemdos(32,L:0) ! Go in to supervisor mode
' you can void the result, since there is
' no return form a reset
Reset%=Lpeek(4) ! Get reset vector
Call Reset% ! Jump there
```

My version, which is I believe the latest, is 1.2. The GEM verson
(PROFESS.PRG) carries a copyright date of 1986, the Lotus look-alike
version is copyright 1987, but both are 1.2.

| too much. The info in the file does not look too bad.

I'm sorry, but that fold info looked pretty nasty to me. I really like
the way Todd has implemented the folding, using separate files. I imagine
this scheme must make the relational features of FOLDED easier to implement
as well (and thus, easier for us to hack on! ;-).

Your points about speed are right on, though - FOLDED could use quite a bit
of optimizing. As you mentioned, though, Todd does explain in the

documentation that it was brought up to be small and functional, and not necessarily a speed demon.

One thing I really like is the way the screen redraws (from the line you're on outwards). But I too wish that it didn't redraw quite so much ;-).

> know you shipped today?" "You don't, and I don't care if you don't believe
> me." Hmmph!

Mr Vederman was never intentionally misled -- we would have nothing to gain by doing so. For our part in the confusion we apologize. There was a delay in shipping the boards and for that I also apologize. We all did everything we could to get the product out on schedule, and I think it is safe to say we were just as anxious to get it out as anyone was to receive it, if not much more so. But we are human, and I am very sorry about any inconvenience the delay caused anyone. The boards, are now shipping, and have been for a couple of weeks.

> Friday rolls around, and after a delay from UPS, I got the board. Looks nice,

> According to the manual, you have to cut 3 pins for the piggy-back, and use
> "fly-wires" to connect the board to the ST. Do I need this for the socket
> installation? No answer in the manual. Trial and error, showed that they
> were not needed.

Actually, there are instructions for installing our product in an ST with the processor removed, and they are different from the piggy-back method and there are some fly-wires necessary. Mr Vederman went on to say that that neither his disk drive nor his hard disk would work with our board. This is cause he didn't put in the fly-wires as instructed in the manual.

We did our best to make the manual clear and understandable, but we're human. I don't believe it's possible to make the manual clear and concise, and answer everyone's questions. That's why we have a full time customer service person. I've found Lilliane to be quite conscientious in helping customers with their problems. Installing our board, or in fact any product inside an ST, is not for the fainthearted. Unless they are comfortable with both circuit boards and soldering irons, we recommend our customers have their dealers install our product.

Starting today, for people who buy an accelerator directly from us and send their computer into us, we will install our board for free. For those who break their ST trying to install our board themselves, we'll fix it for a flat $50, including return shipping.

Mr. Vederman did call us, and Lilliane explained his trouble over the phone. And he got his board working. However, he wasn't able to get FAST-ROM to work for reasons we weren't able to determine over the phone. (The problem may well have been a defective part on our board. We do fully test all of our boards before we ship them, but still a small percentage fail in the field.) We offered to fix his machine with our board in it if he sent it to us (he didn't want to do this because he didn't want to lose the use of his computer -- quite understandable), or to send him a new board, or to refund his money. He chose the latter. Of course we are disappointed and are confident a new board would have solved his problem, but it was his choice. We've never had any allusions that we could please everyone.

> Point of story: I have a $300 paper weight.

No one is ever stuck with one our products. Within 15 days of getting any of our products, it may be returned for an reason for a full refund. And all of our products also carry a six month warranty. We guarantee our products to work and will do what ever it takes to see that they do, or refund the customers money.

I received my DVT VCR HD Backup device and software yesterday.
I ordered it from Computability as advertised in START for $209.00
Currently the software only supports file backup, no image backup,
though the software could easily support it. In START it's advertised
is as storing 8 megabits/minute which would be 1 megabyte/minute right?
I backedup my 'C' partition which contained c12meg of files and it took
35 minutes, which would average out to 333K/minute right? They also
advertised that it stores up to 360 megabytes (per tape I'm assuming).
Using a 120 minute tape, I will only be able to store c48Megabytes/tape.
They must have been using one big tape. They suggest using SP mode,
which is the fastest playing mode (i.e. record 2 hours/tape). For
$209 I guess I got my money's worth, I just hope they come out with
an image backup utility.

I know, we were told not to expect much from GNU EMACS with only 1 Meg, but
after determining that it only used about 300 K text+data+bss I gave it a
shot. Just start it, read some stuff in and push a few keys, nothing serious.
Impressive hardly describes it. Looks just like on the VAX, only it starts
up faster. But I have a couple of ???-s.
The start-up seems to crash rather than finishing normally (something about
invalid argument stringp null, as I remember). Control Z gives a kind of
no-op (the bottom line flashes 'program terminated' ever so briefly, then
I'm back in EMACS. And dired seems to be getting confused, probably by the
$HOME environment variable in \ form (rather than / form) which is really
there for the use of the shell, msh, rather than EMACS.
But the program runs fast, and there's a tremendous amount there. This is
going to be fun to explore.
I hope the diffs from a widely available source distribution show up on
the net.

Aaagh!
Is it just my imagination, or does 10% of the mail in this group really consist of requests for details of piggy back expansions?
Perhaps if I reply, they might desist?

OK peeps, you asked for it..

First off get hold of 16 DRAMs in Dual In Line packages. These look like the ones already fitted along the front right of your ST, if in doubt, quote the section of the device marking which includes the number 256, and ask for an equivalent part. There are far too many to list them all, but basic specs are : 256K x 1 page mode DRAM, 150 nanoseconds or faster, preferably in plastic package (cheaper!), 16 pin DIL outline.
They're not cheap, and prices vary enormously, so shop around.

Each chip has a notch at one end, to show which way up it is fitted. With the notch uppermost, pin 1 is to the left of the notch, pin 8 is at bottom left, pin 9 bottom right, and pin 16 top right. Armed with this information, find pins 4 and 15 on each of your new chips in turn, and bend them CAREFULLY through 180 degrees without breaking them off. Bend them as close to the body of the chip as you can. These are the RAS and CAS pins which work as chip select lines. The chips will normally be supplied in black anti-static foam. Try to keep them there while you bend the pins.

Now, one at a time, sit a new chip on top of one of the built-in DRAMs, with the notch at the same end (!!) and solder each of the other 14 pairs of pins together. Make sure the chips are accurately lined up, use only the minimum of fine multicore solder, and watch out for 'bridges' of solder between adjacent pairs of pins, and solder splashes on the PCB. This takes care of all the address, data, power, and read/write_ lines.

Lastly, locate the MMU chip. This is a square, 68 pin device, U15 on early machines, and probably the one nearest the DRAMs on all versions. This has a pip in the middle of one side to indicate pins 1 & 68.
From the top of the board, they are numbered anticlockwise. Attach one end of a short (300mm or so) length of thin INSULATED wire to each of pins 18 (RAS1), 21 (CAS1LOW), and 22 (CAS1HIGH). Prototyping wire is ideal, particularly the "solder-wrap" type sold in the UK as "Verowire" (R) for around 5.5 pounds. Don't connect directly to the MMU, take the wires through a suitable hole, and trace the pins to the underside of the PCB.
The wire from RAS1 should be soldered to pin 4 of ALL the new DRAMs. If you are skilled enough to do it, a 33 ohm Resistor should be used in series as near to the MMU as possible to dampen reflections on all 3 of these wires, but its omission is unlikely to cause problems.
The wire from CAS1LOW should be soldered to pin 15 of the LEFTmost 8 new DRAMs, and that from CAS1HIGH to the RIGHTmost 8.

That's it. Depending on your confidence and proficiency, it should take
about half to 2 hours. DO try to do it all in one session, and avoid
touching the chips as much as possible, they are static sensitive.
A use ful tip - DISCONNECT the power supply, and attach a lead from the
ground rail around the edge of the board to your metal watch strap. keep the
chips in their foam sitting on a bare area of the ground rail. I'ts not
a static safe workstation, but it's as near as most of you will get.

If you have a hard disk, unhook it before you first try out your handiwork!
If it doesn't work : don't blame me! If your ST runs, but still only with
0.5 MB, check for unsoldered pins, suspect duff chip(s). If it goes crazy,
check for solder shorts, check correct pins used on MMU, take it to your
nearest hardware wiz with a print of these 'destructions'.

Finally, piggybacking 1Mbit DRAMs instead of 256K for 2.5Mbytes :
This is MESSY, the pinouts don't match up well, and several pins need to
be bent through impossible angles. You will need to connect another flying
lead for the extra address from MMU pin 64 to A9 on ALL the 1M drams.
Again the 33 ohm resistor aught to be included as before.
The relevent pinouts follow, I won't go into more detail as I hold the
view that if you can't figure it out from here, you shouldn't attempt to
do it. A useful hint though, apart (perhaps) from A9 (for refresh
considerations), the address pin numbers can be swapped around anyhow
you like, ie A0 can be used as A1 etc..

Viewed from above:

256K DRAM pinout 1M DRAM pinout

notch notch
1 A8 16 Vss 1 Data in 18 Vss
2 Data in 15 CAS_ 2 Write_ 17 Data out
3 Write_ 14 Data out 3 RAS_ 16 CAS_
4 RAS_ 13 A6 4 UNUSED 15 A9
5 A0 12 A3 5 A0 14 A8
6 A2 11 A4 6 A1 13 A7
7 A1 10 A5 7 A2 12 A6
8 Vcc 9 A7 8 A3 11 A5
9 Vcc 10 A4

The above is submitted in good faith, but you use it at your own risk.
If you spot any mistakes, please post to this group first, flame me
later!

This is speculative, but I haven't seen any other suggestions:

putchar and getchar are macros. They expand to putc(c,stdout) and getc(stdin), respectively. Both stdin and stdout are already opened as ASCII files when your program begins execution. The insertion of 0x0D into your data streams is most likely due to the high level handler attempting to add a carriage return (0x0D) when it sees a line feed (0x0A) in the stream.

You can eliminate this by opeing binary input and output files (use "rb" or "wb" as the second parameter in the fopen() call), and use the putc and getc calls directly with the appropriate file handle.

> (I tried it anyway, but it didn't make any difference.) There was a bunch
> of resisters on the board, i'd hate to think that the speed is hard wired.
> Tell me is isn't so! (If it is, which one controls the speed?)

Most of the better 3.5" drives use a phase lock loop to control the drive RPM. They are supposed to be calibrated at the factory (the drive company's, not Atari's) and that is it. Most of them do not have any way to adjust the drive speed after they leave the factory. These are the best drives since they have very stable speeds. It takes a lot of extra drag (eg. pushing very hard on the disk media while spinning) to make them change RPM. But if they aren't correctly calibrated they

stink.

Atari has started using some less expensive drives, belt driven
instead of direct drive, most of them do have adjustments for the drive
speed.

You might try contacting the company that built the drive and
asking if (and how) the drive RPM can be adjusted. Depending on which
company you may or may not get any cooperation.

> There was a little magnet along with, i guess, a magnetic sensor. What is
> this for? (Is the drive speed, chip controled?)

That is probably the drive speed sensor for the PLL. If so then
there is probably nothing you can do to adjust the drive RPM.

Subject: Packed executables
To: info-atari16@score.stanford.edu

With respect to the recently posted pack/unpack programs posted to the binaries
group I have thought about a few problems that might result when packing
executables:-

* How does GEMDOS feel about loading a program with a header that does not
properly reflect the program that will be run? Even if the base-page is
set up accordingly, GEMDOS has seen the weird one first and may have already
set up some internal variables.

* Also when a program is loaded it is given the largest free area of memory.
If there is not enough memory Pexec returns an error. Programs that run
bigger than their header states will cause problems here (stack trampling,
screen corruption, bus errors etc).

* The unpacker that is glued on to the program will have to relocate the host
program itself. Possible future uses of the currently unused odd relocation
values will be lost here.

* It will also break if a TOS patch ever has to modify the program before
executing it.

Personally I am not happy with the idea. Compacting data files is fine and I
like it, but not executable programs.
I invite Atari themselves to to comment on this because they probably know of
even more horror stories that could result (and I can also ask them to post
the Pexec cookbook they promised us long ago).

Subject: DVT VCR Hard Drive backup
To: Atari Newsgroup <INFO-ATARI16@SCORE.STANFORD.EDU>

I received my DVT VCR HD Backup device and software yesterday.
I ordered it from Computability as advertised in START for $209.00
Currently the software only supports file backup, no image backup,
though the software could easily support it. In START it's advertised
is as storing 8 megabits/minute which would be 1 megabyte/minute right?
I backedup my 'C' partition which contained c12meg of files and it took
35 minutes, which would average out to 333K/minute right? They also
advertised that it stores up to 360 megabytes (per tape I'm assuming).
Using a 120 minute tape, I will only be able to store c48Megabytes/tape.
They must have been using one big tape. They suggest using SP mode,
which is the fastest playing mode (i.e. record 2 hours/tape). For
$209 I guess I got my money's worth, I just hope they come out with
an image backup utility.

A friend is trying to sell his complete Mega 4 system. Here is what he has:

Mega 4
Monochrom monitor
Megafile 30
Laser printer
Ultrascript + Extended font package
Spectre 128 + ROMs
Calamus
Page Stream
Time Works DTP

He would like $3600 for everything, and is hoping to get rid of everything by
July 31!!!

He is willing to break up the set. Please give him a call if interested, day
or night. His name is SAM, and his number is 713-493-5160.

I know, we were told not to expect much from GNU EMACS with only 1 Meg, but
after determining that it only used about 300 K text+data+bss I gave it a
shot. Just start it, read some stuff in and push a few keys, nothing serious.
Impressive hardly describes it. Looks just like on the VAX, only it starts
up faster. But I have a couple of ???-s.
The start-up seems to crash rather than finishing normally (something about
invalid argument stringp null, as I remember). Control Z gives a kind of
no-op (the bottom line flashes 'program terminated' ever so briefly, then
I'm back in EMACS. And dired seems to be getting confused, probably by the
$HOME environment variable in \ form (rather than / form) which is really
there for the use of the shell, msh, rather than EMACS.
But the program runs fast, and there's a tremendous amount there. This is
going to be fun to explore.
I hope the diffs from a widely available source distribution show up on
the net.

I recently received the GNU emacs binaries posting. I missed sections 13 through 18 though. They just never showed up. Could someone email these to me. Please make sure someone else has not yet sent them so I don't end up with more than one copy.

Thnaks

mike

> of resisters on the board, i'd hate to think that the speed is hard wired.
> Tell me is isn't so! (If it is, which one controls the speed?)

Most of the better 3.5" drives use a phase lock loop to control the drive RPM. They are supposed to be calibrated at the factory (the drive company's, not Atari's) and that is it. Most of them do not have any way to adjust the drive speed after they leave the factory. These are the best drives since they have very stable speeds. It takes a lot of extra drag (eg. pushing very hard on the disk media while spinning) to make them change RPM. But if they aren't correctly calibrated they

stink.

Atari has started using some less expensive drives, belt driven
instead of direct drive, most of them do have adjustments for the drive
speed.

You might try contacting the company that built the drive and
asking if (and how) the drive RPM can be adjusted. Depending on which
company you may or may not get any cooperation.

> There was a little magnet along with, i guess, a magnetic sensor. What is
> this for? (Is the drive speed, chip controled?)

That is probably the drive speed sensor for the PLL. If so then
there is probably nothing you can do to adjust the drive RPM.

Subject: Packed executables
To: info-atari16@score.stanford.edu

With respect to the recently posted pack/unpack programs posted to the binaries
group I have thought about a few problems that might result when packing
executables:-

* How does GEMDOS feel about loading a program with a header that does not
properly reflect the program that will be run? Even if the base-page is
set up accordingly, GEMDOS has seen the weird one first and may have already
set up some internal variables.

* Also when a program is loaded it is given the largest free area of memory.
If there is not enough memory Pexec returns an error. Programs that run
bigger than their header states will cause problems here (stack trampling,
screen corruption, bus errors etc).

* The unpacker that is glued on to the program will have to relocate the host
program itself. Possible future uses of the currently unused odd relocation
values will be lost here.

* It will also break if a TOS patch ever has to modify the program before
executing it.

Personally I am not happy with the idea. Compacting data files is fine and I
like it, but not executable programs.
I invite Atari themselves to to comment on this because they probably know of
even more horror stories that could result (and I can also ask them to post
the Pexec cookbook they promised us long ago).

Subject: DeskJets and Atari Parallel Port
To: info-atari16@score.stanford.edu

I have been conspicuously silent with respect to the Atari ST parallel port
current sink limit and DeskJet/DeskJet+ pullup resistors.
You see, here's my dilema: The Atari ST is not officially
```

supported for use with the DeskJet printers. This means we have not tested the printer and our support people will be next to useless in resolving problems. They won't tell you to "take a hike, its not supported", rather our support people simply lack Atari expertise to help with any significant technical problems.

Furthermore, I am unable to test and verify any of the proposed solutions to the current limit problem. Using the 7407 buffer on the data and strobe lines should work fine, but as an HP representative I cannot say this is the "HP recommended" solution. You also could use the serial port at 19.2 K baud (in most cases this will not hurt performance) but I have been told by Atari users there are various gotchas when trying to print out the serial port. I still fail to understand how the DeskJet+ could damage an Atari, even though there is one case of anecdotal evidence to the contrary. The current limit could result in marginal logic levels on data and especially strobe, but if the Atari can only sink 1.6ma thats fine, and if the printer tries to draw more the Atari simply cannot supply it -- how can this damage the Atari? If I had an Atari I would definately buffer the parallel port with the 7407 for logic level reliability if nothing else.

If you have sent me mail about this problem and I haven't answered I'm sorry and I hope this posting explains the situation somewhat. I hope this posting is at least slightly better than nothing.

I have encouraged our support people to make a specific statement on Atari support especially relating to the current limit on the parallel port but so far they have not come up with an official position.

To: info-atari16@score.stanford.edu

I have built a cable with the 7407s and use the Tools TeX driver
with no problems, no problems about turning on the computer and
printer in various orders either.

I do have one question, some hp laserjet drivers work and some don't.
My observation: Is it the case that the drivers that work have the
computer do "everything" while those that don't
want to download fonts to the printer? When attempting
to print TeX with a driver that doesn't work the
built in printer fonts are used
and so a mess is created.

Intensive testing of everything I could test intensively (I could still use
an industrial strength RAM test program) really didn't turn anything up. So
in desperation, I re-copied the hard disk driver into the auto folder on my
boot-up disk. No more problem. Go figure.

From: Udo Heinrich <OR160%DBNUOR1.BITNET@Forsythe.Stanford.EDU>
Subject: TeX on Atari ST
To: INFO-ATARI16@SCORE.STANFORD.EDU

Hello!

I want to tell you something about a new Sharware Programm for the
Atari ST. It's called TeX and might be known by everybody. TeX was developed
by E. Knuth in over 10 years hard work. It was written in WEB, a kind of
mega pascal language which is not computer-orientated.
So it was possible to transfirm TeX to "every" kind of computer, also
on the Atari ST.

But what is TeX. I thing some of you know Signum!2 from
Application Systems Heidelberg. TeX is Signum!2 times Signum!2. TeX is a
program that brings your words in the right form, makes for you a
table of contents automatically and footnotes are no more a problem.
But the best of all is the possibility of TeX to make your equation look
like in a book. For example:
You type in: $(x+y)=xc2+2xy+yc2$ and the result is ...
(Sorry, but the monitor can't show you.)

TeX is like a programming language. You have if-cases and so on.
So you want to know something about TeX? Here is a little literature-list:

-for german users: Helmut Kopka; LaTeX, eine Einfuehrung; Addison-
Wesley Publishing Company; Bonn 2. Auflage 1989
(very good, easy to understand, to get results)
-for everyone: D. E. Knuth; The TeXbook; Addison-Wesley P. C.; 1984
(the original, to know everything about TeX)

L. Lamport; A Document Preparation System; A.-W. P. C.
(written by the author of LaTeX, good but I prefare
H. Kopka)

TeX knows all features you need to write a nice letter, your works and
everything else. Another helpful thing ist that you can write your
TeX-text on an editor by your choice. TeX-inputfiles are always
ASCII-Files. So you can copy some files from your VMS- or SUN-machine
and work with it at home (but the up-side-down way is quite more
interesting, because of the possibility to use the laser-printer
of your university and so on).

But what's the new on this 5th version of TeX on Atari ST computers?

Really easy to understand, when I tell you that it is translated into
Turbo-C and compiled. This version is much more faster than the other
and not so expensive because it is shareware.

The price for this TeX-version incl. a shell, a screen- and a print-
previewer, fonts, a short-instruction and several style-files (you need
them to write a book, article, report, letter, descriptions,...), LaTeX

and the 'german-language-file',... is 20 Deutsche Marks for a unregistrated version and 60 Deutsche Mark for a registrated version. The registrated version incl. one backup and a note for every following backups and online-telephone-help for your problems. The package incl. 3 disks packed by ARC (ARC is incl.; makes something about 6 Deutsche Marks for one disk).

And where can you get that really good stuff??

Stefan Lindner
Iltisstrasse 3
8510 Fuerth
West Germany

(if you don't live in West German call Mr. Lindner first, because of the price!)

If you order a version please note, that the price above is the price for orders in West Germany, other lands have different prices because of the post costs.

If you order a version please write a note that you got the information from like this:

"Informations about this TeX version by Udo Heinrich, #00091!"

If you want some more informations send OONNEE SSMMAALL note to me.

Hope the information was useful

Udo Heinrich

I wonder why you would want to do a cold boot in GFA-basic, but I think
this will do it:

```
Slpoke &H420,0 ! Clear Memvalid (makes next boot COLD)
Void Gemdos(32,L:0) ! Go in to supervisor mode
' you can void the result, since there is
' no return form a reset
Reset%=Lpeek(4) ! Get reset vector
Call Reset% ! Jump there
```

| too much. The info in the file does not look too bad.

I'm sorry, but that fold info looked pretty nasty to me. I really like
the way Todd has implemented the folding, using separate files. I imagine
this scheme must make the relational features of FOLDED easier to implement
as well (and thus, easier for us to hack on! ;-).

Your points about speed are right on, though - FOLDED could use quite a bit
of optimizing. As you mentioned, though, Todd does explain in the

documentation that it was brought up to be small and functional, and not necessarily a speed demon.

One thing I really like is the way the screen redraws (from the line you're on outwards). But I too wish that it didn't redraw quite so much ;-).

> me." Hmmph!

Mr Vederman was never intentionally misled -- we would have nothing to gain by doing so. For our part in the confusion we apologize. There was a delay in shipping the boards and for that I also apologize. We all did everything we could to get the product out on schedule, and I think it is safe to say we were just as anxious to get it out as anyone was to receive it, if not much more so. But we are human, and I am very sorry about any inconvenience the delay caused anyone. The boards, are now shipping, and have been for a couple of weeks.

> Friday rolls around, and after a delay from UPS, I got the board. Looks nice,

> "fly-wires" to connect the board to the ST. Do I need this for the socket
> installation? No answer in the manual. Trial and error, showed that they
> were not needed.

Actually, there are instructions for installing our product in an ST with the processor removed, and they are different from the piggy-back method and there are some fly-wires necessary. Mr Vederman went on to say that that neither his disk drive nor his hard disk would work with our board. This is cause he didn't put in the fly-wires as instructed in the manual.

We did our best to make the manual clear and understandable, but we're human. I don't believe it's possible to make the manual clear and concise, and answer everyone's questions. That's why we have a full time customer service person. I've found Lilliane to be quite conscientious in helping customers with their problems. Installing our board, or in fact any product inside an ST, is not for the fainthearted. Unless they are comfortable with both circuit boards and soldering irons, we recommend our customers have their dealers install our product.

Starting today, for people who buy an accelerator directly from us and send their computer into us, we will install our board for free. For those who break their ST trying to install our board themselves, we'll fix it for a flat $50, including return shipping.

Mr. Vederman did call us, and Lilliane explained his trouble over the phone. And he got his board working. However, he wasn't able to get FAST-ROM to work for reasons we weren't able to determine over the phone. (The problem may well have been a defective part on our board. We do fully test all of our boards before we ship them, but still a small percentage fail in the field.) We offered to fix his machine with our board in it if he sent it to us (he didn't want to do this because he didn't want to lose the use of his computer -- quite understandable), or to send him a new board, or to refund his money. He chose the latter. Of course we are disappointed and are confident a new board would have solved his problem, but it was his choice. We've never had any allusions that we could please everyone.

> Point of story: I have a $300 paper weight.

No one is ever stuck with one our products. Within 15 days of getting any of our products, it may be returned for an reason for a full refund. And all of our products also carry a six month warranty. We guarantee our products to work and will do what ever it takes to see that they do, or refund the customers money.

>most popular 16 bit micro in the UK at the mo.). I know for a fact that
>there are at least 10 shops in the Tottenham Court Road area (including
>Silica Shop/Systems and the Virgin Games Store)!

Note that as the last time I was in London (for the Atari User Show)
Virgin Games Store had stopped stocking computer games. They had been
moved to a spot in the Virgin Megastore on Oxford Street nearer
Tottenham Court Road. It also looked like the range they stocked had
gotten smaller, but maybe that's just because the Megastore is so much
bigger than the Games Store. The advantage to the move is that it is
MUCH easier to find the Megastore than the Games Store. The disadvantage
is that once you're in the Megastore, it's painfully difficult to find
the computer games bit.

Silica Shop is also tricky to find. It's upstairs in a building named
'Lion House', at 227 Tottenham Court Road. Go in the main door, and up
the (probably not-running) escalator.

Subject: Cumana External Drive Problem : Or is it?
To: info-atari16@score.stanford.edu

I have just noticed what I think are problems with my Cumana CSA 354
1 Meg Disk Drive which I use as external drive B. It is only 3 months
old and is connected to a 'standard' 3 year-old 1040ST with 'old' TOS in
rom. The problem occurs intermittently in all screen resolutions. Can
anyone offer any help/advice which does not involve taking things to
bits! The symptoms are as follows:

1. Used as a drive for reading only the drive seems to be OK.

2. Random seek tests and speed tests seem to be OK.

3. When used for writing to, single one-off file transfers seem to be OK.
(eg. saving a WP document or program source very 20 minutes or so.)

4. When used for writing to, involving disk to disk copying (Drive A: to
Drive B:) sometimes the internal drive can't read the disk so
produced and neither can any other Atari Disk Drive. Sometimes the
Cumana drive itself can not consistently read its own disk, ie.
sometimes it refuses to read what it has written, ten minutes later,
however, it may read it (after rebooting disk swapping etc).

5. When used for writing to, by copying (say) 30 files from drive A:
some of the 30 files seem to get corrupted. The 'directory' entries
look OK - files sizes OK, etc. but when you list an ASCII file (eg)
you sometimes get garbage in the file instead on the real data.
Program files are corrupted in a similiar way and either they time
bomb out or chunks of code don't work. Unlike 4. the Cumana drive is
never able read the corruption.

6. I have used George Woodside's VKILLER to check for a virus and
nothing's shown up. (I get the problem when I boot up from a wide
range of disks.)

7. The same problem occurs on different media - cheap disks, SONY disks,
Memorex disks, Verbatim, . . .

8. I am not using lots of folders - no more than 10 in a session.

Has anyone got any ideas as to what may be going wrong - I always
thought that TOS verified everything it wrote to a disk (an annoyance
to some people I know)?

Are there any nifty disk checking utilities out there? If so can someone
mail me a disk checker or even a byte-by-byte file comparision program
so that I can reverify files written on the Cumana?

Any help will be gratefully received. Sorry to have gone on at such
length but I felt I had to supply as much information on the problem as
possible - this is my first posting to the net.

(For all I know the drive may have been faulty at birth or got crunched
slightly coping with all that horrible copy protection which makes your
disk drive sound more like a coffee grinder.)

I don't know of any around, but that may be because you don't need one. Just copy the files (not the whole disk, the files) to another (empty) floppy, and they will be made contiguous. If you have a big enough RAMdisk, you can copy the files to it, delete them from the original floppy, then copy them back.

When you use the desktop (or most utility programs) to copy whole disks, the structure (and consequent fragmentation) of the disk is maintained. When you copy the files (or complete folders), the data is accessed as a file, and read and written back as file-sized entities. If the destination is blank, the files are written contiguously.

>
>What now? Does anyone have a similar program that works on tos1.4???

Depending upon which software you are running, there are usually hooks in the auto boot code to allow you to prevent an auto boot whenever you want.

Check the documentation from the vendor of your driver.

The more common ones are holding down a shift key, the Alt key, the
Control key, or some combination of them when powering up your system.

Most bypass techniques are effective only at power up, not at reset.

>
>Why not trash the GEM stuff and the Turtle Logo. I guess that would give you
>more memory. If a program is run as a '.prg' then you can still use the mouse
>via the Line-A routines & variables.

Because that's not the program where the more severe memory constraint is.
"TURTLE.PRG" is the GEM front end. It has the menus, mouse, etc. It does all
the user interface work, and builds a command line for the other program.
"TTLEXEC.TTP" is the program that does the backup work. It has to fit into
memory with the RAMdisk, and that's the one that's squeezed to the max.

The two programs trigger each other via shel_exec, so they have to be
kept the same size in order to fit into the same memory space, once
the RAMdisk is activated.

Since the majority of ST users are not software hackers, I resist the
temptation to implement any non-standard interface techniques. Part of
the elegance of the ST is that, by having GEM built in, it provides
a platform which offers the same user interface across a wide scope of
programs. Given years of remembering obscure control-key commands and
wierd letter-options from CP/M, MS-DOS, and UNIX, I find menus and
clearly explained options in dialog boxes a real pleasure. Point and
click is the next best thing to audible commands, in my opinion.

~On the ST, the end-of-line code is \r\n, not just \n as it is on UNIX.
~In order to output valid text files, C libraries translate \n to \r\n
~on output, and back the other way on input.
~
~Most C compilers on the ST let you pass a "b" modifier to in the second
~parameter of fopen(); this tells the compiler to skip its I/O translation.
~ ...
~Hope that helps.
~
~sgrimm@sun.com ...!sun!sgrimm

Actually I am not getting the \r\n pair just the \r and somewhat
randomly sprinkled throughout the file.

A la UN*X I planned to use the splay program as a filter using
stdin and stdout. Maybe I can write a scratch file fopen'd as
per your sugesstion and then cat the scratch file to stdout via
Pexec or execvec().

Thanks for the reply.

I don't know of any around, but that may be because you don't need one. Just copy the files (not the whole disk, the files) to another (empty) floppy, and they will be made contiguous. If you have a big enough RAMdisk, you can copy the files to it, delete them from the original floppy, then copy them back.

When you use the desktop (or most utility programs) to copy whole disks, the structure (and consequent fragmentation) of the disk is maintained. When you copy the files (or complete folders), the data is accessed as a file, and read and written back as file-sized entities. If the destination is blank, the files are written contiguously.

Depending upon which software you are running, there are usually hooks in the auto boot code to allow you to prevent an auto boot whenever you want.

Check the documentation from the vendor of your driver.

The more common ones are holding down a shift key, the Alt key, the
Control key, or some combination of them when powering up your system.

Most bypass techniques are effective only at power up, not at reset.

>
>Why not trash the GEM stuff and the Turtle Logo. I guess that would give you
>more memory. If a program is run as a '.prg' then you can still use the mouse
>via the Line-A routines & variables.

Because that's not the program where the more severe memory constraint is.
"TURTLE.PRG" is the GEM front end. It has the menus, mouse, etc. It does all
the user interface work, and builds a command line for the other program.
"TTLEXEC.TTP" is the program that does the backup work. It has to fit into
memory with the RAMdisk, and that's the one that's squeezed to the max.

The two programs trigger each other via shel_exec, so they have to be
kept the same size in order to fit into the same memory space, once
the RAMdisk is activated.

Since the majority of ST users are not software hackers, I resist the
temptation to implement any non-standard interface techniques. Part of
the elegance of the ST is that, by having GEM built in, it provides
a platform which offers the same user interface across a wide scope of
programs. Given years of remembering obscure control-key commands and
wierd letter-options from CP/M, MS-DOS, and UNIX, I find menus and
clearly explained options in dialog boxes a real pleasure. Point and
click is the next best thing to audible commands, in my opinion.

Timeline, Inc, 1-800-872-8878 will sell you an adaptec 4000a for $60.
Even the others sell it for $135.

Get the 4070 ONLY if your going to put an RLL drive into your sh204.

I recommend getting a 4000a, and adding an outboarded second drive.

>there are at least 10 shops in the Tottenham Court Road area (including
>Silica Shop/Systems and the Virgin Games Store)!

Note that as the last time I was in London (for the Atari User Show)
Virgin Games Store had stopped stocking computer games. They had been
moved to a spot in the Virgin Megastore on Oxford Street nearer
Tottenham Court Road. It also looked like the range they stocked had
gotten smaller, but maybe that's just because the Megastore is so much
bigger than the Games Store. The advantage to the move is that it is
MUCH easier to find the Megastore than the Games Store. The disadvantage
is that once you're in the Megastore, it's painfully difficult to find
the computer games bit.

Silica Shop is also tricky to find. It's upstairs in a building named
'Lion House', at 227 Tottenham Court Road. Go in the main door, and up
the (probably not-running) escalator.

Subject: Sozobon C
To: info-atari16@score.stanford.edu

I have a 520ST and have recently been given a copy of the Sozobon C compiler,
so far I have been using this with some success to write some small C programs.
One thing that didn't come with the disk (or on it) was any form of
documentation for the compiler etc.. (OK I know it was free, so what do I
expect) But just on the off chance.... is there any one out there who knows
of any such documentation (even if it's just the name of a book I need to buy)
or if anyone has any usefull information about the compiler (like is it
possibleto compile a program on another (RAM) disk ?) I would be grateful for
the info.

Should I receive anything I will of course summarize it for the net !!

Many thanks.

Subject: Cumana External Drive Problem : Or is it?
To: info-atari16@score.stanford.edu

I have just noticed what I think are problems with my Cumana CSA 354
1 Meg Disk Drive which I use as external drive B. It is only 3 months
old and is connected to a 'standard' 3 year-old 1040ST with 'old' TOS in
rom. The problem occurs intermittently in all screen resolutions. Can
anyone offer any help/advice which does not involve taking things to
bits! The symptoms are as follows:

1. Used as a drive for reading only the drive seems to be OK.

2. Random seek tests and speed tests seem to be OK.

3. When used for writing to, single one-off file transfers seem to be OK.
(eg. saving a WP document or program source very 20 minutes or so.)

4. When used for writing to, involving disk to disk copying (Drive A: to
Drive B:) sometimes the internal drive can't read the disk so
produced and neither can any other Atari Disk Drive. Sometimes the
Cumana drive itself can not consistently read its own disk, ie.
sometimes it refuses to read what it has written, ten minutes later,
however, it may read it (after rebooting disk swapping etc).

5. When used for writing to, by copying (say) 30 files from drive A:
some of the 30 files seem to get corrupted. The 'directory' entries
look OK - files sizes OK, etc. but when you list an ASCII file (eg)
you sometimes get garbage in the file instead on the real data.
Program files are corrupted in a similiar way and either they time
bomb out or chunks of code don't work. Unlike 4. the Cumana drive is
never able read the corruption.

6. I have used George Woodside's VKILLER to check for a virus and
nothing's shown up. (I get the problem when I boot up from a wide
range of disks.)

7. The same problem occurs on different media - cheap disks, SONY disks,
Memorex disks, Verbatim, . . .

8. I am not using lots of folders - no more than 10 in a session.

Has anyone got any ideas as to what may be going wrong - I always
thought that TOS verified everything it wrote to a disk (an annoyance
to some people I know)?

Are there any nifty disk checking utilities out there? If so can someone
mail me a disk checker or even a byte-by-byte file comparision program
so that I can reverify files written on the Cumana?

Any help will be gratefully received. Sorry to have gone on at such
length but I felt I had to supply as much information on the problem as
possible - this is my first posting to the net.

(For all I know the drive may have been faulty at birth or got crunched
slightly coping with all that horrible copy protection which makes your
disk drive sound more like a coffee grinder.)

From: hp-pcd!hpvcfs1!neff@hplabs.hp.com (Dave Neff)
Subject: DeskJets and Atari Parallel Port
To: info-atari16@score.stanford.edu

I have been conspicuously silent with respect to the Atari ST parallel port
current sink limit and DeskJet/DeskJet+ pullup resistors.
You see, here's my dilema: The Atari ST is not officially
supported for use with the DeskJet printers. This means we have not
```

tested the printer and our support people will be next to useless in resolving problems. They won't tell you to "take a hike, its not supported", rather our support people simply lack Atari expertise to help with any significant technical problems.

Furthermore, I am unable to test and verify any of the proposed solutions to the current limit problem. Using the 7407 buffer on the data and strobe lines should work fine, but as an HP representative I cannot say this is the "HP recommended" solution. You also could use the serial port at 19.2 K baud (in most cases this will not hurt performance) but I have been told by Atari users there are various gotchas when trying to print out the serial port. I still fail to understand how the DeskJet+ could damage an Atari, even though there is one case of anecdotal evidence to the contrary. The current limit could result in marginal logic levels on data and especially strobe, but if the Atari can only sink 1.6ma thats fine, and if the printer tries to draw more the Atari simply cannot supply it -- how can this damage the Atari? If I had an Atari I would definately buffer the parallel port with the 7407 for logic level reliability if nothing else.

If you have sent me mail about this problem and I haven't answered I'm sorry and I hope this posting explains the situation somewhat. I hope this posting is at least slightly better than nothing.

I have encouraged our support people to make a specific statement on Atari support especially relating to the current limit on the parallel port but so far they have not come up with an official position.

Subject: Re: DeskJets and Atari Parallel Port
To: info-atari16@score.stanford.edu

I have built a cable with the 7407s and use the Tools TeX driver with no problems, no problems about turning on the computer and

printer in various orders either.

I do have one question, some hp laserjet drivers work and some don't.
My observation: Is it the case that the drivers that work have the
computer do "everything" while those that don't
want to download fonts to the printer? When attempting
to print TeX with a driver that doesn't work the
built in printer fonts are used
and so a mess is created.

QuickST 1.5 has fixed almost all of the vt52 terminal emulation
descrepencies, except for that of setting colors (doesn't recognize
the codes, prints garbage) This renders it unusable for me.

Subject: TeX on Atari ST
To: INFO-ATARI16@SCORE.STANFORD.EDU

Hello!

I want to tell you something about a new Sharware Programm for the
Atari ST. It's called TeX and might be known by everybody. TeX was developed
by E. Knuth in over 10 years hard work. It was written in WEB, a kind of
mega pascal language which is not computer-orientated.
So it was possible to transfirm TeX to "every" kind of computer, also
on the Atari ST.

But what is TeX. I thing some of you know Signum!2 from
Application Systems Heidelberg. TeX is Signum!2 times Signum!2. TeX is a
program that brings your words in the right form, makes for you a
table of contents automatically and footnotes are no more a problem.
But the best of all is the possibility of TeX to make your equation look
like in a book. For example:
You type in: $(x+y)=xc2+2xy+yc2$ and the result is ...
(Sorry, but the monitor can't show you.)

TeX is like a programming language. You have if-cases and so on.
So you want to know something about TeX? Here is a little literature-list:

-for german users: Helmut Kopka; LaTeX, eine Einfuehrung; Addison-
Wesley Publishing Company; Bonn 2. Auflage 1989
(very good, easy to understand, to get results)
-for everyone: D. E. Knuth; The TeXbook; Addison-Wesley P. C.; 1984
(the original, to know everything about TeX)

L. Lamport; A Document Preparation System; A.-W. P. C.
(written by the author of LaTeX, good but I prefare
H. Kopka)

TeX knows all features you need to write a nice letter, your works and
everything else. Another helpful thing ist that you can write your
TeX-text on an editor by your choice. TeX-inputfiles are always
ASCII-Files. So you can copy some files from your VMS- or SUN-machine
and work with it at home (but the up-side-down way is quite more
interesting, because of the possibility to use the laser-printer
of your university and so on).

But what's the new on this 5th version of TeX on Atari ST computers?

Really easy to understand, when I tell you that it is translated into
Turbo-C and compiled. This version is much more faster than the other
and not so expensive because it is shareware.

The price for this TeX-version incl. a shell, a screen- and a print-
previewer, fonts, a short-instruction and several style-files (you need
them to write a book, article, report, letter, descriptions,...), LaTeX
and the 'german-language-file',... is 20 Deutsche Marks for a unregistrated

version and 60 Deutsche Mark for a registrated version. The registrated version incl. one backup and a note for every following backups and online-telephone-help for your problems. The package incl. 3 disks packed by ARC (ARC is incl.; makes something about 6 Deutsche Marks for one disk).

And where can you get that really good stuff??

Stefan Lindner
Iltisstrasse 3
8510 Fuerth
West Germany

(if you don't live in West German call Mr. Lindner first, because of the price!)

If you order a version please note, that the price above is the price for orders in West Germany, other lands have different prices because of the post costs.

If you order a version please write a note that you got the information from like this:

"Informations about this TeX version by Udo Heinrich, #00091!"

If you want some more informations send OONNEE SSMMAALL note to me.

Hope the information was useful

Udo Heinrich

To: info-atari16@score.stanford.edu

Hello, I just got a spreadsheet program off the net. Maybe you too have seen it, its called Opus and it seems to be just the thing I have been looking for. But, alas, there is one small problem. In order to do charting from the program one has to have GDOS. Well, I thought, I'll just pull the GDOS stuff off my DEGAS disk and use it here. No, that didn't work.
To make a long story short, if that is still possible, does anybody out there have any idea how to get this damn thing to work. I sure haven't figured it out yet.
You can either mail me a reply, or post your response here. Makes no diff to me.
Thanks in advance.

I wonder why you would want to do a cold boot in GFA-basic, but I think
this will do it:

```
Slpoke &H420,0 ! Clear Memvalid (makes next boot COLD)
Void Gemdos(32,L:0) ! Go in to supervisor mode
' you can void the result, since there is
' no return form a reset
Reset%=Lpeek(4) ! Get reset vector
Call Reset% ! Jump there
```

| too much. The info in the file does not look too bad.

I'm sorry, but that fold info looked pretty nasty to me. I really like
the way Todd has implemented the folding, using separate files. I imagine
this scheme must make the relational features of FOLDED easier to implement
as well (and thus, easier for us to hack on! ;-).

Your points about speed are right on, though - FOLDED could use quite a bit
of optimizing. As you mentioned, though, Todd does explain in the

documentation that it was brought up to be small and functional, and not necessarily a speed demon.

One thing I really like is the way the screen redraws (from the line you're on outwards). But I too wish that it didn't redraw quite so much ;-).

> know you shipped today?" "You don't, and I don't care if you don't believe
> me." Hmmph!

Mr Vederman was never intentionally misled -- we would have nothing to gain by doing so. For our part in the confusion we apologize. There was a delay in shipping the boards and for that I also apologize. We all did everything we could to get the product out on schedule, and I think it is safe to say we were just as anxious to get it out as anyone was to receive it, if not much more so. But we are human, and I am very sorry about any inconvenience the delay caused anyone. The boards, are now shipping, and have been for a couple of weeks.

> Friday rolls around, and after a delay from UPS, I got the board. Looks nice,

> According to the manual, you have to cut 3 pins for the piggy-back, and use
> "fly-wires" to connect the board to the ST. Do I need this for the socket
> installation? No answer in the manual. Trial and error, showed that they
> were not needed.

Actually, there are instructions for installing our product in an ST with the processor removed, and they are different from the piggy-back method and there are some fly-wires necessary. Mr Vederman went on to say that that neither his disk drive nor his hard disk would work with our board. This is cause he didn't put in the fly-wires as instructed in the manual.

We did our best to make the manual clear and understandable, but we're human. I don't believe it's possible to make the manual clear and concise, and answer everyone's questions. That's why we have a full time customer service person. I've found Lilliane to be quite conscientious in helping customers with their problems. Installing our board, or in fact any product inside an ST, is not for the fainthearted. Unless they are comfortable with both circuit boards and soldering irons, we recommend our customers have their dealers install our product.

Starting today, for people who buy an accelerator directly from us and send their computer into us, we will install our board for free. For those who break their ST trying to install our board themselves, we'll fix it for a flat $50, including return shipping.

Mr. Vederman did call us, and Lilliane explained his trouble over the phone. And he got his board working. However, he wasn't able to get FAST-ROM to work for reasons we weren't able to determine over the phone. (The problem may well have been a defective part on our board. We do fully test all of our boards before we ship them, but still a small percentage fail in the field.) We offered to fix his machine with our board in it if he sent it to us (he didn't want to do this because he didn't want to lose the use of his computer -- quite understandable), or to send him a new board, or to refund his money. He chose the latter. Of course we are disappointed and are confident a new board would have solved his problem, but it was his choice. We've never had any allusions that we could please everyone.

> Point of story: I have a $300 paper weight.

No one is ever stuck with one our products. Within 15 days of getting any of our products, it may be returned for an reason for a full refund. And all of our products also carry a six month warranty. We guarantee our products to work and will do what ever it takes to see that they do, or refund the customers money.

I received my DVT VCR HD Backup device and software yesterday.
I ordered it from Computability as advertised in START for $209.00
Currently the software only supports file backup, no image backup,
though the software could easily support it. In START it's advertised
is as storing 8 megabits/minute which would be 1 megabyte/minute right?
I backedup my 'C' partition which contained c12meg of files and it took
35 minutes, which would average out to 333K/minute right? They also
advertised that it stores up to 360 megabytes (per tape I'm assuming).
Using a 120 minute tape, I will only be able to store c48Megabytes/tape.
They must have been using one big tape. They suggest using SP mode,
which is the fastest playing mode (i.e. record 2 hours/tape). For
$209 I guess I got my money's worth, I just hope they come out with
an image backup utility.

I know, we were told not to expect much from GNU EMACS with only 1 Meg, but
after determining that it only used about 300 K text+data+bss I gave it a
shot. Just start it, read some stuff in and push a few keys, nothing serious.
Impressive hardly describes it. Looks just like on the VAX, only it starts
up faster. But I have a couple of ???-s.
The start-up seems to crash rather than finishing normally (something about
invalid argument stringp null, as I remember). Control Z gives a kind of
no-op (the bottom line flashes 'program terminated' ever so briefly, then
I'm back in EMACS. And dired seems to be getting confused, probably by the
$HOME environment variable in \ form (rather than / form) which is really
there for the use of the shell, msh, rather than EMACS.
But the program runs fast, and there's a tremendous amount there. This is
going to be fun to explore.
I hope the diffs from a widely available source distribution show up on
the net.

Subject: 1MB piggyback details - how to [LONG]
To: info-atari16@score.stanford.edu

Aaagh!
Is it just my imagination, or does 10% of the mail in this group really consist of requests for details of piggy back expansions?
Perhaps if I reply, they might desist?

OK peeps, you asked for it..

First off get hold of 16 DRAMs in Dual In Line packages. These look like the ones already fitted along the front right of your ST, if in doubt, quote the section of the device marking which includes the number 256, and ask for an equivalent part. There are far too many to list them all, but basic specs are : 256K x 1 page mode DRAM, 150 nanoseconds or faster, preferably in plastic package (cheaper!), 16 pin DIL outline.
They're not cheap, and prices vary enormously, so shop around.

Each chip has a notch at one end, to show which way up it is fitted. With the notch uppermost, pin 1 is to the left of the notch, pin 8 is at bottom left, pin 9 bottom right, and pin 16 top right. Armed with this information, find pins 4 and 15 on each of your new chips in turn, and bend them CAREFULLY through 180 degrees without breaking them off. Bend them as close to the body of the chip as you can. These are the RAS and CAS pins which work as chip select lines. The chips will normally be supplied in black anti-static foam. Try to keep them there while you bend the pins.

Now, one at a time, sit a new chip on top of one of the built-in DRAMs, with the notch at the same end (!!) and solder each of the other 14 pairs of pins together. Make sure the chips are accurately lined up, use only the minimum of fine multicore solder, and watch out for 'bridges' of solder between adjacent pairs of pins, and solder splashes on the PCB. This takes care of all the address, data, power, and read/write_ lines.

Lastly, locate the MMU chip. This is a square, 68 pin device, U15 on early machines, and probably the one nearest the DRAMs on all versions. This has a pip in the middle of one side to indicate pins 1 & 68.
From the top of the board, they are numbered anticlockwise. Attach one end of a short (300mm or so) length of thin INSULATED wire to each of pins 18 (RAS1), 21 (CAS1LOW), and 22 (CAS1HIGH). Prototyping wire is ideal, particularly the "solder-wrap" type sold in the UK as "Verowire" (R) for around 5.5 pounds. Don't connect directly to the MMU, take the wires through a suitable hole, and trace the pins to the underside of the PCB.
The wire from RAS1 should be soldered to pin 4 of ALL the new DRAMs. If you are skilled enough to do it, a 33 ohm Resistor should be used in series as near to the MMU as possible to dampen reflections on all 3 of these wires, but its omission is unlikely to cause problems.
The wire from CAS1LOW should be soldered to pin 15 of the LEFTmost 8 new DRAMs, and that from CAS1HIGH to the RIGHTmost 8.

That's it. Depending on your confidence and proficiency, it should take
about half to 2 hours. DO try to do it all in one session, and avoid
touching the chips as much as possible, they are static sensitive.
A use ful tip - DISCONNECT the power supply, and attach a lead from the
ground rail around the edge of the board to your metal watch strap. keep the
chips in their foam sitting on a bare area of the ground rail. I'ts not
a static safe workstation, but it's as near as most of you will get.

If you have a hard disk, unhook it before you first try out your handiwork!
If it doesn't work : don't blame me! If your ST runs, but still only with
0.5 MB, check for unsoldered pins, suspect duff chip(s). If it goes crazy,
check for solder shorts, check correct pins used on MMU, take it to your
nearest hardware wiz with a print of these 'destructions'.

Finally, piggybacking 1Mbit DRAMs instead of 256K for 2.5Mbytes :
This is MESSY, the pinouts don't match up well, and several pins need to
be bent through impossible angles. You will need to connect another flying
lead for the extra address from MMU pin 64 to A9 on ALL the 1M drams.
Again the 33 ohm resistor aught to be included as before.
The relevent pinouts follow, I won't go into more detail as I hold the
view that if you can't figure it out from here, you shouldn't attempt to
do it. A useful hint though, apart (perhaps) from A9 (for refresh
considerations), the address pin numbers can be swapped around anyhow
you like, ie A0 can be used as A1 etc..

Viewed from above:

256K DRAM pinout 1M DRAM pinout

notch notch
1 A8 16 Vss 1 Data in 18 Vss
2 Data in 15 CAS_ 2 Write_ 17 Data out

This is speculative, but I haven't seen any other suggestions:

putchar and getchar are macros. They expand to putc(c,stdout) and getc(stdin), respectively. Both stdin and stdout are already opened as ASCII files when your program begins execution. The insertion of 0x0D into your data streams is most likely due to the high level handler attempting to add a carriage return (0x0D) when it sees a line feed (0x0A) in the stream.

You can eliminate this by opeing binary input and output files (use "rb" or "wb" as the second parameter in the fopen() call), and use the putc and getc calls directly with the appropriate file handle.

> Tell me is isn't so! (If it is, which one controls the speed?)

Most of the better 3.5" drives use a phase lock loop to control the drive RPM. They are supposed to be calibrated at the factory (the drive company's, not Atari's) and that is it. Most of them do not have any way to adjust the drive speed after they leave the factory. These are the best drives since they have very stable speeds. It takes a lot of extra drag (eg. pushing very hard on the disk media while spinning) to make them change RPM. But if they aren't correctly calibrated they

stink.

Atari has started using some less expensive drives, belt driven
instead of direct drive, most of them do have adjustments for the drive
speed.

You might try contacting the company that built the drive and
asking if (and how) the drive RPM can be adjusted. Depending on which
company you may or may not get any cooperation.

That is probably the drive speed sensor for the PLL. If so then
there is probably nothing you can do to adjust the drive RPM.

Subject: Packed executables
To: info-atari16@score.stanford.edu

With respect to the recently posted pack/unpack programs posted to the binaries
group I have thought about a few problems that might result when packing
executables:-

* How does GEMDOS feel about loading a program with a header that does not
properly reflect the program that will be run? Even if the base-page is
set up accordingly, GEMDOS has seen the weird one first and may have already
set up some internal variables.

* Also when a program is loaded it is given the largest free area of memory.
If there is not enough memory Pexec returns an error. Programs that run
bigger than their header states will cause problems here (stack trampling,
screen corruption, bus errors etc).

* The unpacker that is glued on to the program will have to relocate the host
program itself. Possible future uses of the currently unused odd relocation
values will be lost here.

* It will also break if a TOS patch ever has to modify the program before
executing it.

Personally I am not happy with the idea. Compacting data files is fine and I
like it, but not executable programs.
I invite Atari themselves to to comment on this because they probably know of
even more horror stories that could result (and I can also ask them to post
the Pexec cookbook they promised us long ago).

Subject: DVT VCR Hard Drive backup
To: Atari Newsgroup <INFO-ATARI16@SCORE.STANFORD.EDU>

I received my DVT VCR HD Backup device and software yesterday.
I ordered it from Computability as advertised in START for $209.00
Currently the software only supports file backup, no image backup,
though the software could easily support it. In START it's advertised
is as storing 8 megabits/minute which would be 1 megabyte/minute right?
I backedup my 'C' partition which contained c12meg of files and it took
35 minutes, which would average out to 333K/minute right? They also
advertised that it stores up to 360 megabytes (per tape I'm assuming).
Using a 120 minute tape, I will only be able to store c48Megabytes/tape.
They must have been using one big tape. They suggest using SP mode,
which is the fastest playing mode (i.e. record 2 hours/tape). For
$209 I guess I got my money's worth, I just hope they come out with
an image backup utility.

I know, we were told not to expect much from GNU EMACS with only 1 Meg, but
after determining that it only used about 300 K text+data+bss I gave it a
shot. Just start it, read some stuff in and push a few keys, nothing serious.
Impressive hardly describes it. Looks just like on the VAX, only it starts
up faster. But I have a couple of ???-s.
The start-up seems to crash rather than finishing normally (something about
invalid argument stringp null, as I remember). Control Z gives a kind of
no-op (the bottom line flashes 'program terminated' ever so briefly, then
I'm back in EMACS. And dired seems to be getting confused, probably by the
$HOME environment variable in \ form (rather than / form) which is really
there for the use of the shell, msh, rather than EMACS.
But the program runs fast, and there's a tremendous amount there. This is
going to be fun to explore.
I hope the diffs from a widely available source distribution show up on
the net.
Steve J.

Subject: 1MB piggyback details - how to [LONG]
To: info-atari16@score.stanford.edu

Aaagh!
Is it just my imagination, or does 10% of the mail in this group really consist of requests for details of piggy back expansions?
Perhaps if I reply, they might desist?

OK peeps, you asked for it..

First off get hold of 16 DRAMs in Dual In Line packages. These look like the ones already fitted along the front right of your ST, if in doubt, quote the section of the device marking which includes the number 256, and ask for an equivalent part. There are far too many to list them all, but basic specs are : 256K x 1 page mode DRAM, 150 nanoseconds or faster, preferably in plastic package (cheaper!), 16 pin DIL outline.
They're not cheap, and prices vary enormously, so shop around.

Each chip has a notch at one end, to show which way up it is fitted. With the notch uppermost, pin 1 is to the left of the notch, pin 8 is at bottom left, pin 9 bottom right, and pin 16 top right. Armed with this information, find pins 4 and 15 on each of your new chips in turn, and bend them CAREFULLY through 180 degrees without breaking them off. Bend them as close to the body of the chip as you can. These are the RAS and CAS pins which work as chip select lines. The chips will normally be supplied in black anti-static foam. Try to keep them there while you bend the pins.

Now, one at a time, sit a new chip on top of one of the built-in DRAMs, with the notch at the same end (!!) and solder each of the other 14 pairs of pins together. Make sure the chips are accurately lined up, use only the minimum of fine multicore solder, and watch out for 'bridges' of solder between adjacent pairs of pins, and solder splashes on the PCB. This takes care of all the address, data, power, and read/write_ lines.

Lastly, locate the MMU chip. This is a square, 68 pin device, U15 on early machines, and probably the one nearest the DRAMs on all versions. This has a pip in the middle of one side to indicate pins 1 & 68.
From the top of the board, they are numbered anticlockwise. Attach one end of a short (300mm or so) length of thin INSULATED wire to each of pins 18 (RAS1), 21 (CAS1LOW), and 22 (CAS1HIGH). Prototyping wire is ideal, particularly the "solder-wrap" type sold in the UK as "Verowire" (R) for around 5.5 pounds. Don't connect directly to the MMU, take the wires through a suitable hole, and trace the pins to the underside of the PCB.
The wire from RAS1 should be soldered to pin 4 of ALL the new DRAMs. If you are skilled enough to do it, a 33 ohm Resistor should be used in series as near to the MMU as possible to dampen reflections on all 3 of these wires, but its omission is unlikely to cause problems.
The wire from CAS1LOW should be soldered to pin 15 of the LEFTmost 8 new DRAMs, and that from CAS1HIGH to the RIGHTmost 8.

That's it. Depending on your confidence and proficiency, it should take
about half to 2 hours. DO try to do it all in one session, and avoid
touching the chips as much as possible, they are static sensitive.
A use ful tip - DISCONNECT the power supply, and attach a lead from the
ground rail around the edge of the board to your metal watch strap. keep the
chips in their foam sitting on a bare area of the ground rail. I'ts not
a static safe workstation, but it's as near as most of you will get.

If you have a hard disk, unhook it before you first try out your handiwork!
If it doesn't work : don't blame me! If your ST runs, but still only with
0.5 MB, check for unsoldered pins, suspect duff chip(s). If it goes crazy,
check for solder shorts, check correct pins used on MMU, take it to your
nearest hardware wiz with a print of these 'destructions'.

Finally, piggybacking 1Mbit DRAMs instead of 256K for 2.5Mbytes :
This is MESSY, the pinouts don't match up well, and several pins need to
be bent through impossible angles. You will need to connect another flying
lead for the extra address from MMU pin 64 to A9 on ALL the 1M drams.
Again the 33 ohm resistor aught to be included as before.
The relevent pinouts follow, I won't go into more detail as I hold the
view that if you can't figure it out from here, you shouldn't attempt to
do it. A useful hint though, apart (perhaps) from A9 (for refresh
considerations), the address pin numbers can be swapped around anyhow
you like, ie A0 can be used as A1 etc..

Viewed from above:

256K DRAM pinout 1M DRAM pinout

notch notch
1 A8 16 Vss 1 Data in 18 Vss
2 Data in 15 CAS_ 2 Write_ 17 Data out
3 Write_ 14 Data out 3 RAS_ 16 CAS_
4 RAS_ 13 A6 4 UNUSED 15 A9
5 A0 12 A3 5 A0 14 A8
6 A2 11 A4 6 A1 13 A7
7 A1 10 A5 7 A2 12 A6
8 Vcc 9 A7 8 A3 11 A5
9 Vcc 10 A4

The above is submitted in good faith, but you use it at your own risk.

Subject: DVT VCR Hard Drive backup
To: Atari Newsgroup <INFO-ATARI16@SCORE.STANFORD.EDU>

I received my DVT VCR HD Backup device and software yesterday.
I ordered it from Computability as advertised in START for $209.00
Currently the software only supports file backup, no image backup,
though the software could easily support it. In START it's advertised
is as storing 8 megabits/minute which would be 1 megabyte/minute right?
I backedup my 'C' partition which contained c12meg of files and it took
35 minutes, which would average out to 333K/minute right? They also
advertised that it stores up to 360 megabytes (per tape I'm assuming).
Using a 120 minute tape, I will only be able to store c48Megabytes/tape.
They must have been using one big tape. They suggest using SP mode,
which is the fastest playing mode (i.e. record 2 hours/tape). For
$209 I guess I got my money's worth, I just hope they come out with
an image backup utility.

A friend is trying to sell his complete Mega 4 system. Here is what he has:

Mega 4
Monochrom monitor
Megafile 30
Laser printer
Ultrascript + Extended font package
Spectre 128 + ROMs
Calamus
Page Stream
Time Works DTP

He would like $3600 for everything, and is hoping to get rid of everything by
July 31!!!

He is willing to break up the set. Please give him a call if interested, day
or night. His name is SAM, and his number is 713-493-5160.

I know, we were told not to expect much from GNU EMACS with only 1 Meg, but
after determining that it only used about 300 K text+data+bss I gave it a
shot. Just start it, read some stuff in and push a few keys, nothing serious.
Impressive hardly describes it. Looks just like on the VAX, only it starts
up faster. But I have a couple of ???-s.
The start-up seems to crash rather than finishing normally (something about
invalid argument stringp null, as I remember). Control Z gives a kind of
no-op (the bottom line flashes 'program terminated' ever so briefly, then
I'm back in EMACS. And dired seems to be getting confused, probably by the
$HOME environment variable in \ form (rather than / form) which is really
there for the use of the shell, msh, rather than EMACS.
But the program runs fast, and there's a tremendous amount there. This is
going to be fun to explore.
I hope the diffs from a widely available source distribution show up on
the net.

Aaagh!
Is it just my imagination, or does 10% of the mail in this group really consist of requests for details of piggy back expansions?
Perhaps if I reply, they might desist?

OK peeps, you asked for it..

First off get hold of 16 DRAMs in Dual In Line packages. These look like the ones already fitted along the front right of your ST, if in doubt, quote the section of the device marking which includes the number 256, and ask for an equivalent part. There are far too many to list them all, but basic specs are : 256K x 1 page mode DRAM, 150 nanoseconds or faster, preferably in plastic package (cheaper!), 16 pin DIL outline.
They're not cheap, and prices vary enormously, so shop around.

Each chip has a notch at one end, to show which way up it is fitted. With the notch uppermost, pin 1 is to the left of the notch, pin 8 is at bottom left, pin 9 bottom right, and pin 16 top right. Armed with this information, find pins 4 and 15 on each of your new chips in turn, and bend them CAREFULLY through 180 degrees without breaking them off. Bend them as close to the body of the chip as you can. These are the RAS and CAS pins which work as chip select lines. The chips will normally be supplied in black anti-static foam. Try to keep them there while you bend the pins.

Now, one at a time, sit a new chip on top of one of the built-in DRAMs, with the notch at the same end (!!) and solder each of the other 14 pairs of pins together. Make sure the chips are accurately lined up, use only the minimum of fine multicore solder, and watch out for 'bridges' of solder between adjacent pairs of pins, and solder splashes on the PCB. This takes care of all the address, data, power, and read/write_ lines.

Lastly, locate the MMU chip. This is a square, 68 pin device, U15 on early machines, and probably the one nearest the DRAMs on all versions. This has a pip in the middle of one side to indicate pins 1 & 68.
From the top of the board, they are numbered anticlockwise. Attach one end of a short (300mm or so) length of thin INSULATED wire to each of pins 18 (RAS1), 21 (CAS1LOW), and 22 (CAS1HIGH). Prototyping wire is ideal, particularly the "solder-wrap" type sold in the UK as "Verowire" (R) for around 5.5 pounds. Don't connect directly to the MMU, take the wires through a suitable hole, and trace the pins to the underside of the PCB.
The wire from RAS1 should be soldered to pin 4 of ALL the new DRAMs. If you are skilled enough to do it, a 33 ohm Resistor should be used in series as near to the MMU as possible to dampen reflections on all 3 of these wires, but its omission is unlikely to cause problems.
The wire from CAS1LOW should be soldered to pin 15 of the LEFTmost 8 new DRAMs, and that from CAS1HIGH to the RIGHTmost 8.

That's it. Depending on your confidence and proficiency, it should take
about half to 2 hours. DO try to do it all in one session, and avoid
touching the chips as much as possible, they are static sensitive.
A use ful tip - DISCONNECT the power supply, and attach a lead from the
ground rail around the edge of the board to your metal watch strap. keep the
chips in their foam sitting on a bare area of the ground rail. I'ts not
a static safe workstation, but it's as near as most of you will get.

If you have a hard disk, unhook it before you first try out your handiwork!
If it doesn't work : don't blame me! If your ST runs, but still only with
0.5 MB, check for unsoldered pins, suspect duff chip(s). If it goes crazy,
check for solder shorts, check correct pins used on MMU, take it to your
nearest hardware wiz with a print of these 'destructions'.

Finally, piggybacking 1Mbit DRAMs instead of 256K for 2.5Mbytes :
This is MESSY, the pinouts don't match up well, and several pins need to
be bent through impossible angles. You will need to connect another flying
lead for the extra address from MMU pin 64 to A9 on ALL the 1M drams.
Again the 33 ohm resistor aught to be included as before.
The relevent pinouts follow, I won't go into more detail as I hold the
view that if you can't figure it out from here, you shouldn't attempt to
do it. A useful hint though, apart (perhaps) from A9 (for refresh
considerations), the address pin numbers can be swapped around anyhow
you like, ie A0 can be used as A1 etc..

Viewed from above:

256K DRAM pinout 1M DRAM pinout

notch notch
1 A8 16 Vss 1 Data in 18 Vss
2 Data in 15 CAS_ 2 Write_ 17 Data out
3 Write_ 14 Data out 3 RAS_ 16 CAS_
4 RAS_ 13 A6 4 UNUSED 15 A9
5 A0 12 A3 5 A0 14 A8
6 A2 11 A4 6 A1 13 A7
7 A1 10 A5 7 A2 12 A6
8 Vcc 9 A7 8 A3 11 A5
9 Vcc 10 A4

The above is submitted in good faith, but you use it at your own risk.
If you spot any mistakes, please post to this group first, flame me
later!

>but on the ST I get extra 0x0D's (\r) in the output!

This is speculative, but I haven't seen any other suggestions:

putchar and getchar are macros. They expand to putc(c,stdout) and getc(stdin), respectively. Both stdin and stdout are already opened as ASCII files when your program begins execution. The insertion of 0x0D into your data streams is most likely due to the high level handler attempting to add a carriage return (0x0D) when it sees a line feed (0x0A) in the stream.

You can eliminate this by opeing binary input and output files (use "rb" or "wb" as the second parameter in the fopen() call), and use the putc and getc calls directly with the appropriate file handle.

This is true. However, consider Professional Page (full Postscript color seperations (4096 soon to be 16 mil)) and X-Cad. And remember you can run

both of them at the same time, and you can add an '030 to your system (A2000 without hacking) and a math co-processor (68882) and lots of good NTSC compatible video software available, and...

Don't kid yourself, this isn't an easy choice. I chose to go with the company with the least amount of vaporware...

> (I tried it anyway, but it didn't make any difference.) There was a bunch
> of resisters on the board, i'd hate to think that the speed is hard wired.
> Tell me is isn't so! (If it is, which one controls the speed?)

Most of the better 3.5" drives use a phase lock loop to control the drive RPM. They are supposed to be calibrated at the factory (the drive company's, not Atari's) and that is it. Most of them do not have any way to adjust the drive speed after they leave the factory. These are the best drives since they have very stable speeds. It takes a lot of extra drag (eg. pushing very hard on the disk media while spinning) to make them change RPM. But if they aren't correctly calibrated they

stink.

Atari has started using some less expensive drives, belt driven
instead of direct drive, most of them do have adjustments for the drive
speed.

You might try contacting the company that built the drive and
asking if (and how) the drive RPM can be adjusted. Depending on which
company you may or may not get any cooperation.

> There was a little magnet along with, i guess, a magnetic sensor. What is
> this for? (Is the drive speed, chip controled?)

That is probably the drive speed sensor for the PLL. If so then
there is probably nothing you can do to adjust the drive RPM.

Subject: Packed executables
To: info-atari16@score.stanford.edu

With respect to the recently posted pack/unpack programs posted to the binaries
group I have thought about a few problems that might result when packing
executables:-

* How does GEMDOS feel about loading a program with a header that does not
properly reflect the program that will be run? Even if the base-page is
set up accordingly, GEMDOS has seen the weird one first and may have already
set up some internal variables.

* Also when a program is loaded it is given the largest free area of memory.
If there is not enough memory Pexec returns an error. Programs that run
bigger than their header states will cause problems here (stack trampling,
screen corruption, bus errors etc).

* The unpacker that is glued on to the program will have to relocate the host
program itself. Possible future uses of the currently unused odd relocation
values will be lost here.

* It will also break if a TOS patch ever has to modify the program before
executing it.

Personally I am not happy with the idea. Compacting data files is fine and I
like it, but not executable programs.
I invite Atari themselves to to comment on this because they probably know of
even more horror stories that could result (and I can also ask them to post
the Pexec cookbook they promised us long ago).

Subject: DeskJets and Atari Parallel Port
To: info-atari16@score.stanford.edu

I have been conspicuously silent with respect to the Atari ST parallel port
current sink limit and DeskJet/DeskJet+ pullup resistors.
You see, here's my dilema: The Atari ST is not officially
supported for use with the DeskJet printers. This means we have not
```

tested the printer and our support people will be next to useless in resolving problems. They won't tell you to "take a hike, its not supported", rather our support people simply lack Atari expertise to help with any significant technical problems.

Furthermore, I am unable to test and verify any of the proposed solutions to the current limit problem. Using the 7407 buffer on the data and strobe lines should work fine, but as an HP representative I cannot say this is the "HP recommended" solution. You also could use the serial port at 19.2 K baud (in most cases this will not hurt performance) but I have been told by Atari users there are various gotchas when trying to print out the serial port. I still fail to understand how the DeskJet+ could damage an Atari, even though there is one case of anecdotal evidence to the contrary. The current limit could result in marginal logic levels on data and especially strobe, but if the Atari can only sink 1.6ma thats fine, and if the printer tries to draw more the Atari simply cannot supply it -- how can this damage the Atari? If I had an Atari I would definately buffer the parallel port with the 7407 for logic level reliability if nothing else.

If you have sent me mail about this problem and I haven't answered I'm sorry and I hope this posting explains the situation somewhat. I hope this posting is at least slightly better than nothing.

I have encouraged our support people to make a specific statement on Atari support especially relating to the current limit on the parallel port but so far they have not come up with an official position.

Subject: Re: DeskJets and Atari Parallel Port
To: info-atari16@score.stanford.edu

I have built a cable with the 7407s and use the Tools TeX driver with no problems, no problems about turning on the computer and

printer in various orders either.

I do have one question, some hp laserjet drivers work and some don't.
My observation: Is it the case that the drivers that work have the
computer do "everything" while those that don't
want to download fonts to the printer? When attempting
to print TeX with a driver that doesn't work the
built in printer fonts are used
and so a mess is created.

From: Udo Heinrich <OR160%DBNUOR1.BITNET@Forsythe.Stanford.EDU>
Subject: TeX on Atari ST
To: INFO-ATARI16@SCORE.STANFORD.EDU

Hello!

I want to tell you something about a new Sharware Programm for the
Atari ST. It's called TeX and might be known by everybody. TeX was developed
by E. Knuth in over 10 years hard work. It was written in WEB, a kind of
mega pascal language which is not computer-orientated.
So it was possible to transfirm TeX to "every" kind of computer, also
on the Atari ST.

But what is TeX. I thing some of you know Signum!2 from
Application Systems Heidelberg. TeX is Signum!2 times Signum!2. TeX is a
program that brings your words in the right form, makes for you a
table of contents automatically and footnotes are no more a problem.
But the best of all is the possibility of TeX to make your equation look
like in a book. For example:
You type in: $(x+y)=xc2+2xy+yc2$ and the result is ...
(Sorry, but the monitor can't show you.)

TeX is like a programming language. You have if-cases and so on.
So you want to know something about TeX? Here is a little literature-list:

-for german users: Helmut Kopka; LaTeX, eine Einfuehrung; Addison-
Wesley Publishing Company; Bonn 2. Auflage 1989
(very good, easy to understand, to get results)
-for everyone: D. E. Knuth; The TeXbook; Addison-Wesley P. C.; 1984
(the original, to know everything about TeX)

L. Lamport; A Document Preparation System; A.-W. P. C.
(written by the author of LaTeX, good but I prefare
H. Kopka)

TeX knows all features you need to write a nice letter, your works and
everything else. Another helpful thing ist that you can write your
TeX-text on an editor by your choice. TeX-inputfiles are always
ASCII-Files. So you can copy some files from your VMS- or SUN-machine
and work with it at home (but the up-side-down way is quite more
interesting, because of the possibility to use the laser-printer
of your university and so on).

But what's the new on this 5th version of TeX on Atari ST computers?

Really easy to understand, when I tell you that it is translated into
Turbo-C and compiled. This version is much more faster than the other
and not so expensive because it is shareware.

The price for this TeX-version incl. a shell, a screen- and a print-
previewer, fonts, a short-instruction and several style-files (you need
them to write a book, article, report, letter, descriptions,...), LaTeX
and the 'german-language-file',... is 20 Deutsche Marks for a unregistrated

version and 60 Deutsche Mark for a registrated version. The registrated version
incl. one backup and a note for every following backups and
online-telephone-help for your problems. The package incl. 3 disks
packed by ARC (ARC is incl.; makes something about 6 Deutsche Marks for
one disk).

And where can you get that really good stuff??

Stefan Lindner
Iltisstrasse 3
8510 Fuerth
West Germany

(if you don't live in West German call Mr. Lindner first, because of
the price!)

If you order a version please note, that the price above is the price
for orders in West Germany, other lands have different prices because
of the post costs.

If you order a version please write a note that you got the information
from like this:

"Informations about this TeX version by Udo Heinrich, #00091!"

If you want some more informations send OONNEE SSMMAALL note to me.

Hope the information was useful

Udo Heinrich

To: info-atari16@score.stanford.edu

Hello, I just got a spreadsheet program off the net. Maybe you too have
seen it, its called Opus and it seems to be just the thing I have been looking
for. But, alas, there is one small problem. In order to do charting from
the program one has to have GDOS. Well, I thought, I'll just pull the GDOS
stuff off my DEGAS disk and use it here. No, that didn't work.
To make a long story short, if that is still possible, does anybody out
there have any idea how to get this damn thing to work. I sure haven't
figured it out yet.
You can either mail me a reply, or post your response here. Makes no diff
to me.
Thanks in advance.

I wonder why you would want to do a cold boot in GFA-basic, but I think
this will do it:

```
Slpoke &H420,0 ! Clear Memvalid (makes next boot COLD)
Void Gemdos(32,L:0) ! Go in to supervisor mode
' you can void the result, since there is
' no return form a reset
Reset%=Lpeek(4) ! Get reset vector
Call Reset% ! Jump there
```

My version, which is I believe the latest, is 1.2. The GEM verson
(PROFESS.PRG) carries a copyright date of 1986, the Lotus look-alike
version is copyright 1987, but both are 1.2.

| too much. The info in the file does not look too bad.

I'm sorry, but that fold info looked pretty nasty to me. I really like
the way Todd has implemented the folding, using separate files. I imagine
this scheme must make the relational features of FOLDED easier to implement
as well (and thus, easier for us to hack on! ;-).

Your points about speed are right on, though - FOLDED could use quite a bit
of optimizing. As you mentioned, though, Todd does explain in the

documentation that it was brought up to be small and functional, and not necessarily a speed demon.

One thing I really like is the way the screen redraws (from the line you're on outwards). But I too wish that it didn't redraw quite so much ;-).

> me." Hmmph!

Mr Vederman was never intentionally misled -- we would have nothing to gain by doing so. For our part in the confusion we apologize. There was a delay in shipping the boards and for that I also apologize. We all did everything we could to get the product out on schedule, and I think it is safe to say we were just as anxious to get it out as anyone was to receive it, if not much more so. But we are human, and I am very sorry about any inconvenience the delay caused anyone. The boards, are now shipping, and have been for a couple of weeks.

> installation? No answer in the manual. Trial and error, showed that they
> were not needed.

Actually, there are instructions for installing our product in an ST with the processor removed, and they are different from the piggy-back method and there are some fly-wires necessary. Mr Vederman went on to say that that neither his disk drive nor his hard disk would work with our board. This is cause he didn't put in the fly-wires as instructed in the manual.

We did our best to make the manual clear and understandable, but we're human. I don't believe it's possible to make the manual clear and concise, and answer everyone's questions. That's why we have a full time customer service person. I've found Lilliane to be quite conscientious in helping customers with their problems. Installing our board, or in fact any product inside an ST, is not for the fainthearted. Unless they are comfortable with both circuit boards and soldering irons, we recommend our customers have their dealers install our product.

Starting today, for people who buy an accelerator directly from us and send their computer into us, we will install our board for free. For those who break their ST trying to install our board themselves, we'll fix it for a flat $50, including return shipping.

Mr. Vederman did call us, and Lilliane explained his trouble over the phone. And he got his board working. However, he wasn't able to get FAST-ROM to work for reasons we weren't able to determine over the phone. (The problem may well have been a defective part on our board. We do fully test all of our boards before we ship them, but still a small percentage fail in the field.) We offered to fix his machine with our board in it if he sent it to us (he didn't want to do this because he didn't want to lose the use of his computer -- quite understandable), or to send him a new board, or to refund his money. He chose the latter. Of course we are disappointed and are confident a new board would have solved his problem, but it was his choice. We've never had any allusions that we could please everyone.

> Point of story: I have a $300 paper weight.

No one is ever stuck with one our products. Within 15 days of getting any of our products, it may be returned for an reason for a full refund. And all of our products also carry a six month warranty. We guarantee our products to work and will do what ever it takes to see that they do, or refund the customers money.

This sounds a lot like sour grapes. "I can't have it, so it can't be any good."

You want to know how to make a million dollars? Write a program, or design a piece of hardware that will make an AT multi-task transparently. Same thing if you're using for a Mac. APPLE and IBM/Compaq/Dell/... would buy it in an instant. The industry seems to recognize the value of Multi-tasking. Witness OS/2, VM-386, the 386 itself, Multi-finder, UNIX, QNX, etc... Just think of the money that could've been saved if they had hired Greg Csullog as a consultant. He could've told them that nobody needs or wants multi-tasking.

At work we use PS/2 Model 70 - A21's with 120 MB disks and 6 MB ram just so we can use VM-386 which provides multi-tasking of DOS applications. Let me tell you that it's a real kludge, but it's the best we can do. I know, you're talking about home multi-tasking, but you'd really like to go back to a single-tasking machine at home after using one all day at work?

> Yep the Amiga has multi-tasking; how many people REALLY benefit from it (I
> know this will spark a "look at me" response but I'm talking widespread use
> of multitasking, not isolated examples)?

If you're counting votes, then put me down for one "I REALLY benefit from it".

>retro-fit multitasking into a machine not designed for it is at best a
>frustrating job whose results may not justify the effort.

I was really trying to make two points:
1) Multitasking is good, even on a single user system, since it allows more efficient use of the CPU through background tasks.
2) This should be designed into the system from the start so as to minimize the overhead. (Greg made this one much clearer than I did.)

Conclusion: The next generation of Atari machines should be multitasking ones. Any hints as to whether this will happen Atari?

I would appreciate an OPUS version that allows the user to draw
charts at least on the screen. I do not see any reason why that
should not be possible. Fiddling around with the ASSIGN.SYS
file should be an option, but not required. Even if the screen
and printer fonts do not match it should be possible to print
the charts. Better a printed chart looking a little bit
distorted than no output at all.

862. Atari SH204 Hard Drive

Newsgroup: comp.sys.atari.st
Date: 1989-08-05 20:39:42 UTC
From: lodzins@pilot.njin.net
Message-ID: <Aug.5.16.39.41.1989.15694@pilot.njin.net>
Source record: 248985

My Atari SH204 hard drive has recently been having problems. It didn't want to autoboot, load programs or do much of anything. I had a backup that wasn't too old, so I tried to fromat it with Atari HD Utils V1.7. I got over 150 errors while formatting it before I gave up. I then got Atari HD Utils V3.01. I gave it a shot, and formatted it with no errors. I thought I was in business. I installed the auto boot with the Atari Install program. I then proceeded to reboot and restore. I had previously partitioned it into two ten meg partitions. After the restore, which was about 4 megs of data, I rebooted. The desktop came up with drive C and D there. When I opened up C, most of my directories were only 1 letter. I clicked on some of the folders and they wouldn't open. I also booted with Folder100 program so I know it wasn't the 40 folder bug. I hate to send it back if it is only a minor problem like a bad cable or something. At first I thought it was the drive mechanism, but when it formatted with no errors I changed my mind and am now confused. Can you tell me what it sounds like to you, if that is possible from what I have told you here, or what other options I can try before I have to send it to get fixed/replaced. Thanks.

>Darek & Co. could probably get still better performance if they wrote
>a version of QuickST that uses the blitter...

this is something we have been grappling with quite a bit lately since we are continuously looking for ways to increase GEM speed. the blitter is basically good for one thing: copying and clearing of large rectangular areas. i believe, and correct me if i'm wrong, but most of the work that goes on in GEM based programs is usually the opening of windows, drawing dialog boxes and alert boxes, or, getting down to the nitty gritty, simply lots of text plotting and line drawing (ie: boxes, menus, dialog buttons). the blitter does not do any of these things, simply the blitting (copying) of one rectangular area to another, and clearing (or filling??) or rectangular areas. thus, myself and darek chose to rewrite the text plotting and line drawing algorithms used in the Atari ROMs so that those functions would run at their peak performance. we have left the copying of bit blocks to the operating system since this is NOT done as often as line drawing or text plotting.

as for the scroll test, we did indeed write our own scroll routine, since the majority of st owners do not have the (legendary??) blitter chip, and that our 127% (or whatever the latest stats say) is much better than leaving the operating system to do it. the blitter is about 3-5% better in this case, but in reality, how often do you scroll complete screenfuls of VT-52 text?? therefore, rather than try to detect the presence of the stupid blitter, and then set up all the idiotic parameters needed to do a blit, we call our much simpler routine inside QuickST to do the screen blit for scrolling the screen. sure, blitter owners may loose 5% for screen scrolls, but the savings in code space by not worrying about the blitter i think more than justified not using the blitter (remember, on every GEM call we would have to test for the presence of the blitter, which would impair performance slightly over what we have now, for very little gained. and since more people do NOT have a blitter than vice versa, faster code was deemed more important than blitter

compatibility.)

i hope that straigtens out the blitter controversy with Quick ST. now if someone (like at atari) is willing to send me a blitter to put in my 1040ST, then maybe, just maybe, we could re-consider .... :-) :-)

Continuing the discussion prompted by jbww@ukc.ac.uk (J.B.W.Webber)

Quote: (for those who missed this wish)
thus the user is up and running, without having to wait for
the whole network to boot, ramdisks/caches to be filled.
By the time one is ready to, say, C compile, the compiler parts,
libraries etc. are sitting in memory, on the relevant processors.

i.e. the first part of a pipeline of processes : by the time the data
pops out of the first part of the pipeline, the program can be
in place for the next.

Endquote

Well I won't trash the idea, it doesn't deserve it, but if you think on
it a bit further, you'll realise that parallel PROCESSORS aren't enough.
Your programmes, libraries, data etc.. are stored as SERIAL data, so you
can only load one item (part item if you multi-task and thrash the drive)
at a time.
To realise your wish, you'll have to store executables on one drive, and
data (sources) on another. Then multi processors with both private (during
upload) and shared (during e.g. compile) memory areas can both access
their resources simultaneously.
It'll get a bit messy when you have to decide exactly what to keep on
each drive, and no doubt you'll end up with some duplication, with all
the associated problems maintaining 2 copies..

Maybe someone'll do it one day. If it weren't for the dreamers among
us we'd still be living in trees.

Dave E.

Host adapters for the Atari is a touchy subject.....
Some of the later embedded SCSI drives are too fast for older host
adapters.
In gereral I have tested quite a few drives and found that Supra (08)
series is the most compatable, it will handle just about every HD and
SCSI type available.
Older versions of Supra are incompatable with faster embedded SCSI
drives.
ICD will handle most of the HD's on the market but I was unsucessfull at
getting faster Maxtor 8000 series to work properly.
But in general , they are my second choice.
Both the Atari and Berkley systems work with slower controllers like teh
Adaptec and OMTI but they work poorly with faster type embedded SCSI
drives!
In general Atari SH204 works fine with teh supplied HD, but if you plan
on adding a second drive....WATCH OUT!

> as file transfers in the background!

I happen to agree 100%. If you are going to do multiasking correctly, you need the proper OS. Tos with Beckemeyer's RTX is the best I've got and is actually fairly stable until you run out of memory (very easy to do on 1 megs) This way, a getty can be polling the serial ports for a login from some RS232 device such as a remote computer via modem, thus creating a form of network. Files may be sent from machine to machine for storage/printing etc. Something along the lines of ANET-midi combined with my message networker. You may also, of course, run whatever else you want to in the background.

The thing is, the OS and the getty program must be stable enough to avoid a reset for hopefully days if not weeks. We really need TOS 1.4 - my os is broken. My last set of 6 1040 roms cost me $30+tax. Microsoft sells each version of MS-DOS seperately, but theirs works.

What about this german university multi-tasking RTOS????? Seems like this would be as easy to obtain as 1.4 - does it lie on top of TOS or replace the roms?

-
-You don't need a full blown multitasking environment for something as simple
-as file transfers in the background!

Alright! 8) If I want to run spell-checking on a document in my word processor, heck, re-write the word processor so that it runs in the background. After all, I don't need a full blown multitasking environment for something as simple as spell-checking in the background. While I'm at it, I might as well re-write my database manager so that it'll generate reports, re-index, and sort in the background; re-write my spreadsheet program so that it'll recalculate in the background; re-write the CAD program so that it'll re-draw in the background.
Hmmm, I think I'll be one old fool by the time I'm done making changes to all these programs so that I could do something as simple as spell-check, recalc, report generation, re-index, sort, and re-draw in the background without needing a full blown multitasking environment. Not to mention that my CS prof will probably hit me on the head with the complete Unix manuals... 8)
I hope by now you'll realize that by having a multitasking environment, both the user and the developer will not have to worry about how to get a program to run concurrently with another, because the system takes care of that for you.

TOS 1.4 formated disk will work all right on IBM...
I small change in the format or boot-sector i think....

I've no idea about 1.4, but I've noticed that the version of TOS I'm running creates FAT tables with a media descriptor of 0xF7, and uses a 512 byte cluster size, 5 block FAT tables, root 11..17, data 18..1439 (for double sided). Now PC's won't recognise this, but if you format a 3.5" disk on a PC, you get descriptor 0xF9, and the ST *will* access these correctly. So the answer for anyone wishing to maintain compatability in TOS < 1.4 would be to create the file systems on the PC. Of course it's a simple matter to write a program to create an 0xF9 file system anyway.

873. Is there an X server for the Atari ST?

Hi,

I have heard some rumors about an X server for the Atari ST.
Is this thing for real? I mean, has anybody seen it running?
I guess an X server should have a fast connection to the host?
Is this done via Ethernet or is a serial line fast enough?

If you know where to get an X server or an Ethernet-adapter
for the Atari ST, please let me know.

Thank you

Michael

This phenomenon annoys enough people that it's worth while repeating: nearly any disk formatted on an ST will be handled properly by a PS/2 if the first 3 bytes of the 'boot sector' are made (3 bytes in hex to follow) EB 34 90. I've done this for years with no problems. The reverse process, formatting on the PS/2 and using on both machines, suffers from the famous problem that IBM machines don't put unique serial numbers on each disk. Yeah, CHKDSK recognizes that there's something funny about the disk, and some compatibles won't take them, but for ST - PS/2 exchange, this is enough.

Since I'm a great fan of fixing things with a sector editor, I'll jump in. DRFLOPPY is a shareware sector editor that is mostly useful for changing boot sectors, because it's a mite finicky about total sectors per track. MEMFILE is probably better all-around; I believe it is entirely free, and it was included with the PD collection distributed with the first edition of NEODESK. Neither one should be hard to find on BBS-s.

Oh really? Then how do you explain the appearance of Minix (a Unix
look-alike) for the Atari ST?

I have cross posted this to the Minix newsgroup. I thought you (Thomas)
might be interested in telling those who gave the ST multitasking
just why what they have done is not possible.

I agree that the Atari hardware is not designed for multitasking but
that does not make it impossible, only less efficient. By creating
multitasking systems for the ST (like Minix and MX2) people are telling
Atari that we want multitasking and would like the hardware to
support it.

just wondering: what does the atari do if you give it more than
4 Mb of memory. will the mmu generate an address error for an access greater
than the 4Mb limit, or what. if so, that seems to cripple the 16Mb limit of
the 68000 in a big way.

speaking of boards for the Megas: what is out there anyways. anyone care
to compile a complete as possible list of peripheral cards available for
the Mega that connect to the internal bus slot. it would be interesting to
know what people are doing with the expansion slot.

Using a beta copy of TOS 1.4, it took about 5 minutes to copy a partition file-by-file on my hard drive. It took about a half hour on the old (mega) TOS. Programs pop up on the screen instantly. Many small, annoying bugs like the 40-folder limit are also gone, so you can basically empty your auto folder.

We'd love to have some kind of switching ability here, so that we would not have to keep quitting Calamus, going into the drawing program, touching up a graphic, quitting the drawing program, and going back into Calamus again (the story of our lives). As for true multi-tasking, I'd kill for it, but my wife (who is an editor and layout artist) would probably rarely use it.

The advantage of multi-tasking is that every program would not have to try to emulate every other program (note the plethora of programs with file functions like copy and disk format built-into them), and that different sorts of programs would not have to compete with each other, but could come together into some kind of large, useful whole.

Ok, time for me to get a little payback. Back when I said that Gilamn Louie's 'slander letter' would hurt the ST more than anyone cared to realize I was ignored - Pete just causing trouble again, right? Well I'm back a few months later with just two of what I'm sure are many cases of the effects of Mr. Louie's smear campaign against the ST in the computer and gaming press.

By the way...

I never did see that retract that was promised in the CO with Gilman and I looked everywhere...

Exhibit A:

CHESS LIFE
August 1989 issue

United States Chess Federation
186 Route 9 W
New Windsor, New York 12550

Page 23, Article: What's New in Chess Software
by Eric Schiller

"CHESSBASE II IS HERE AT LAST!

ChessBase is at work on a Mac version - though it probably will not be ready for a long time, and it seems they have finally realized the truth about the Atari. So (at present) - go with MS-DOS for that program. I am sure that they will continue to support the Atari, but slumping sales of that machine are not likely to produce major improvements. In any event, MS-DOS is the best operating system of the three for portable machines, and it is clearly useful to be able to take the program along when playing in major events."

Background: ChessBase is one of the most powerful chess programs and databases. Mr Schiller obviously shows up his pro-MS-DOS bias and has apparently never heard of the Stacy given his portability comments. Not only that, but Mr Schiller also apparently has access to Atari sales records that no one else has seemed to be able to get a hold of ! I would like to know where Mr Schiller gets his information that sales of the ST are 'slumping', in New York there are selling ST systems as fast as they arrive. Not only that, but ChessBase is also widely used by many GrandMasters - who use the program on the ST in Europe - where it was first intorduced. In fact Gary Kasparov, the current World

Champion, uses a Mega 4 for his Chess data storage and has pushed for
the sale of Atari computers in the Soviet Union to further chess in
that country!

Exhibit B:

The Wargamer Magazine
July-August 1989 issue
Vol. 2 Number 14

Wargamer & Moves magazines
P.O. Box 1289
Salinas, CA 1289

I am using a (two actually) CASIO HT-6000 music keyboards with ATARI STs.
I am looking for someone else who has used this combination or just owns
the CASIO HT 700, 3000 or 6000 keyboards.

I also need info from someone about the effectiveness of the program "M"
for the Atari ST. How easy to use is it and how "powerful". Are there
other programs that do the same "creation" stuff?

A legalotechnical question. On some BBSs I have seen collections of pop
tunes downloadable as MIDI program files....whether they are for sale or
not...is it legal to "reproduce" songs as, say, MUSIC STUDIO or Dr. T's
KCS files?

thanks for your input....(midi or otherwise ;-))

/imran

=>ST. Jeez, at 8 MHz on a 68000 without a co-processor, I'm having trouble
=>getting good performance running one application at a time.
[stuff deleted...]
=>Want to run a word processor and a spreadsheet at the same time. No problem,
=>get REVOLVER and switch between apps.
=
=First off, the majority of applications are user input driven. Meaning that
=if the user doesn't provide input, the program is idle. For instance,

how about compiles? these SHOULD go in the background more often than not.
no input needed...

=You asked for simple common uses for multi-tasking on the Amiga. Here are
=two of the more common, less demanding uses of multi-tasking that I do on my
=Amiga 2000:
=
[describes a user-initiated edit/cli switch]

this is not a good example. you are simply task switching, something that
programs like revolver can do.

[describes another user-initiated switch, disk full/cli delete scenario]

this, again is a simple switch of which program is executing. i think the
general topic concerns doing several tasks simultaneously (i.e. let the os
kernel do the context switch based on some scheduling mechanism). this way
you can be compiling something (or doing some database, raytrace, etc op)
while you read mail, play a game, or compile another program.

=The question "Why do you need multi-tasking on a personal computer?" is much
=like the question "Why do you need more than 64k in a personal computer?"
=which people were asking 8-10 years ago. Once you have, you realize that
=you can't live without it.
=
=Rich Champeaux (rachamp@mbunix.mitre.org)

agreed...

without an mmu to police memory, the os has to do it. this is terribly
slow, IMHO. you just don't want one task stepping on another.

Let me start out by saying that I bought my 520ST in July of 1985. My understanding is that it may have been the 2nd Atari ST sold in the province of Ontario. Next I moved to a 1040ST and now I have a Mega 2. Before I became a VAR for a dealer in Ottawa, I arranged a group purchase of STs. Now, with the VAR effort I have either sold, arranged the purchase or spawned the purchase of over 100 Atari STs (not bad considering I live in a town with 4000 residents!). Locally, I'm known as mister Atari. BUT, BUT, BUT...

More and more I wonder why I stick with Atari since it's getting harder to justify them. The price advantage is gone over the PCs and the 68000 crowd has moved to 68020s and 68030s (except for Atari). From what I read about the Amiga it makes me wonder when Atari is going to release its infamous 68030 TT.

Maybe I'm losing faith because it's so late. Please Atari, I've worked my tail off promoting your products - how about something to put me back on the path of the Atari faithful before I lose all faith in "power without the price".

What's all this about NEEDING memory segmentation for Multitasking. You can have Multitasking without memory segmentation. (Of course memory segmentation helps a lot). Just look at several multitasking OSs for the ST, all running without a REAL MMU: OS-9/68000, IDRIS, RTOS-UH/Pearl, MINIX-ST, Xinu, (what else ?).

Of course, forking processes becomes slow, but not impossible (see MINIX-ST). Also, one of your tasks may clobber another any time by writing into it's memory (but that's more a problem of coding).

Multitasking essentially is the sharing of one major resource in a computer, namely the CPU, among several processes by switching the process currently running rapidly between several processes ready to run at the given moment, thus making it appear as if each of these processes were being executed concurrently. If you have the so-called round robin scheduling mechanism, each ready process gets a time slice, and the more processes there are ready to run, the fewer time slices each of them gets, so they apparently execute slower and slower, the higher the load climbs.

Multitasking as such has nothing to do with memory protection (which is why Xinu can be made to run on an LSI/11 [see D. Comer: Operating system design, the XINU approach]).

I hope this convinces everybody that multitasking is possible (even if not feasible due to lack of speed) on the ST.

Martin

PS: Everything I said above really only (barely) scratches the surface of the matter.

I have just finished a graphic satellite tracking program that tracks as many satellites as you have elements for (the elements posted to sci.space come in real handy!!!) The satellite positions are updated about once every 6 seconds or so for the 98 satellites listed in the current batch of orbital elements. It is very pretty to watch, since the satellites leave contrails on a background map of the world -- very pretty to watch -- like kinetic art.

It is written in GFA Basic 2.0 -- If anyone wants a copy let me know. It is being sent to comp.sources.atari.st, but some people can't wait!

I don't program the Amiga at a low level, so I don't know exactly how it works.
I do know, however, that if I am running a task which has a higher priority
than the CPU-intensive task, I NEVER have sluggish response from the foreground
task. Try it sometime and see for yourself.

Well I'm sure glad I don't have to bias my purchase decisions about terminal programs, word processors, databases, and every other piece of productivity software based on whether or not it will do it's thing in the background. Because on the Amiga, you know it will. Not to mention countless other useful applications of multitasking.

>might work for you!

This might not be of much help for you (outside of West Germany), but
there exists another harddisk driver for the Atari ST, called CBHD.

It is really great:

- Up to 12 (twelve) partitions
- \AUTO\, ACC's, and DESKTOP.INF can be read from *ANY* partition,
e.g. I have one partition setup for using my DTP program with the
SLM804, and another partition setup for using the DTP program for
Postscript output. Yet another partition will be used to start
MINIX from my harddisk.

To do all this you can press the key coressponding to the partition
you want to 'boot' from (In reality the booting is done from the
partition I marked as bootable using the software accompanying the
CBHD driver, only the \AUTO\ folder, the ACC's, and DEKSTOP.INF
are read from the specified partition).
- Partitions can be set to read-only
- Any Partition can be the boot partition
- Partitions can be left out during boot time by pressing the
SHIFT key
- The ALT key trick works also
- You can park the heads of the harddisk by using an ACC
- The same ACC allows you to get statistics from the HD
+ Set Partitions to read-only
+ Simulate a media-change to GEMDOS
+ Increase the number of folders correctly (I read that the
AHDI tries to do this also, but doesn't even know of
Blitter TOS, so you had to use the FOLDRxxx.PRG)
- CBHD is also able to recognize a second harddisk connected to a
controller (which AHDI can't - as far as I know ...)

All this - and a lot more of really excellent stuff - is contained in
a floppy which is available with the book

SCHEIBENKLEISTER II by Claus Brod, Anton Stepper, published by
MAXON in West Germany. Price: DM 79.00 (US$ 35.00).

As far as I know it isn't available in English (yet?).

But - provided your German is good enough this book is an absolute
must for all trying to understand floppy disk, harddisks, CD-ROM, ...

897. Piggy back DIY upgrades

Newsgroup: comp.sys.atari.st
Date: 1989-08-07 10:18:00 UTC
From: AWINFHAH@HMARL5.BITNET
Message-ID: <8908070940.AA25858@ucbvax.Berkeley.EDU>
Source record: 248920

There has been a lot of upgrading stuff on the net lately. Many of them discuss some type of piggy back method. This may be somewhat tricky. The address lines have a 33 ohm series resistor between the MMU and the RAM array. Somebody noted that they are there to limit the current drawn from the MMU. This only partially true. Another (and probably the main) purpose of the resistors is to avoid ringing on the address lines.

Due to the length of the traces on the PCB and capacitive loading by the inputs of the RAM chips, this gives some LC circuit behaviour. The 33 ohm resistor damps oscillations, and thus the resistor value is more or less critical.

Now there are three possibilities.
1. Atari picked the right value for 1 bank installed. In this case the resistors are a bit too large when you install the second bank. This can cause address setup time problems (causing unexplainable crashes).
2. Atari picked the right value for 2 banks installed. In this case the RAM chips that are at the far end from the MMU can be in danger due to ringing on the address lines. I haven't seen any blown RAMs in a 520, but it was a well known problem in the early PC cloning days.
3. Atari picked a value that is nearly good in both cases.

I think number 1 is true for the old 520s (in which case they probably have 68 ohm resistors), while number 2 should be true for the 520+, the 1040 and the Mega.

I invite inside-the-ST experts to comment.

898. TOS 1.4 question

Newsgroup: comp.sys.atari.st

Message-ID: <265@spcc386.UUCP>
Source record: 248922

Quite a lot of people have asked for the list of ST NEWS distributors,
so here it is.
The next issue will be finished next week and it will be a bit special
since it is the 25th issue. We went to the UK and visited almost every
Atari (games) software house around, like Magnetic Scrolls, Argonaut,
Hewson, Grandslam, Microprose, Ocean, US Gold, Mirrorsoft and some more.
We also visited some people at home like Steve Bak, Jeff Minter, Peter
Johnson, Pete Lyon and David Whittaker
So the next one will not be a regular issue, but it will completely
cover our 17-day journey through England including train strikes.
Anyway, here is the list. It's BIG, be warned.

(By the way, you send those people a disk plus enough postage to reply
and they send it back containing the latest issue. The ones with a (*)
behind their name run a regular PD service and you buy the disk there)

Last april there were some rumours about a new release
of WordPerfect 4.1 for the Atari ST. Is it released?
Does it work with the Atari SM194 (the 19" Moniterm monitor,
which Atari is selling in Europe)?

901. deskjet pageformatter

Newsgroup: comp.sys.atari.st
Date: 1989-08-07 12:37:00 UTC
From: HOESEL@HGRRUG52.BITNET
Message-ID: <8908071137.AA00916@ucbvax.Berkeley.EDU>
Source record: 248924

I have problems with understanding the pageformatter in the deskjet firmware. I have a deskjet plus and thought that it has a 16kB input buffer and in addition to that a large outputbuffer (propably more then 16kB). The page-formatter is a program in the deskjet that allows to write on random positions to the paper (the is the same principle as with laserprinters). However the deskjet pageformatter is memory limited: as soon as memory fills the topline in the buffer is printed. So you cannot write completely random to the paper, but for subscripts and superscripts emulations (as done by some wordprocessing programs) this is a good idea.

Now here comes my problem: if the pageformatter would work correctly, then why do some programs succeed in outputting is such a way that more then the usual amount of ink is used in some spots. For example the laserjet driver of wordperfect 4.1 will emulate bold characters simply by overprinting them slightly shifted (I know that I can change this driver, and I did, so bold characters are now printed using the deskjet internal bold fonts). What happens is that these slightly shifted characters do overlap and produce twice the amount of ink. These seems very strange, given the pageformatter. It also happens many time with the epson-emulation cardrige.

Also with some programs that produce text by using the graphic capabilities of the deskjet it happens that only a very small row of dots is printed at a time (much less then 50, the amount that could be printed in one stroke of the printerhead).

could someone explain this?

remark on deskjet with atari: I heard from Michael Ritzer that it was very easy to build a bufferchip inside the cable. use the 74hct645n chip. get the power from pin 32 of the centronics port (on the printer side of the cable). The 74hct645n is pin-compatible with the 245, but make sure you use the 74hct645n. This one works (I use it now, build into a small plastic box (the one used for commercial null-modem devicec. they are very cheap)). use the B-pins as input and the A-pins as output. this is done by connecting the pin 'dir' and the 'enable' pin both to ground. The voltage drop on pin 32 is at the most 1Volt and the chip keeps working at this level. btw. pin 32 is the !error output from the printer. it is high until a fatal error occurs (which almost never happens))

greetings,
frans

HOESEL@HGRRUG52

>as file transfers in the background!

The point is that with an operating system that supports multi-tasking, you don't need special software to accomplish these tasks. Someone sent me mail telling me that they could do the things I mentioned with well written software. Well, if your OS multi-tasks, you can do it with ALL your software, not just the well written ones. Most of what I use on my Amiga is PD software. I can't imagine that a PD author would take the time to put in all of the tricks "well written software" do to emulate a multi-tasking enviroment. On the Amiga, I can spawn off a child task with less than 10 lines of code. After that it's running indepently; I don't have to take care of the task switching. I can then communicate with it through global structures, or more properly, with the Amiga's message passing system.

By the way, I'm using the Amiga as an example to say "Multi-tasking is the best", I'm not trying to use multi-tasking as an example to say "The Amiga is the best."

Anyways, as far as multi-tasking goes; don't knock it 'til you've tried it.

Think twice about PageStream if you're going to be doing serious work.
You need a DTP program which will use licensed fonts. I saw the output
from PageStream once, and the fonts were sub-hideous. I understand that
they were optimized for the irregularities of a dot-matrix printer
(where they look OK), but maybe they're just bad for lasers. Even if
you try using Postscript, you'll still be stuck with weak character
spacing.

>=Rich Champeaux (rachamp@mbunix.mitre.org)
>

Agreed. The two things I mentioned are not very demanding of a multi-tasking OS, and could be performed by something like REVOLVER. The original author said he didn't want "look at me" examples, he wanted examples of things that everyone might use. To truely make use of running programs simultaneanously, you need a program that requires no user input and will run for a long time. Compiling programs doesn't quite fit the bill. When I'm compiling programs, rarely do I say, "Gee, I have 30 seconds while the compiler is running, lets load up a game." I have raytraced animations in the background while I'm writting programs, or I'm calling a BBS. If the raytracer is put at a lower priority than what I'm currently running, you almost can't tell it's there. Best of all, you don't have to give up your computer for several days.

Ahh, the hell with it. It's not worth arguing about. You can lead a horse to water, but you can't make him drink. Let him die of thirst, if that's what he wants.

>
>without an mmu to police memory, the os has to do it. this is terribly
>slow, IMHO. you just don't want one task stepping on another.
>
>-bill
>rosenkra@boston.cray.com

Now there's a point to debate. Do you really need memory protection on a single user multi-tasking computer. On a multi-user computer, memory protection is a necessity, since if one user's program crashes, you don't want to bring down the 50 other users. On a personal computer, where cost is an important factor, is it really necessary? (kind of sounds like the question "Is multi-tasking really necessary?" doesn't it?)
It would, however, be really nice.

This won't help you much, but I've just recently been looking at SCSI in general, and it seems to be a small networking system already. You can have up to eight devices on the SCSI bus. There is no restriction as to what function the 8 devices perform, you could have any mix of processors and periferals. The devices arbitrate for bus access as part of the SCSI protocol in hardware/firmware usually in single chip SCSI controllers.

All one would have to do is write networking software -- the hardware seems to already exist: such as disk drives with imbedded SCSI interfaces, and the Atari ST to SCSI host adapters that you can buy from places like ICD.

It would seem that one should be able to hook several ST's and a disk drive or two together with the right cableing (and some SCSI host adapters for the ST's) with no problems. Maybe write some software to make one ST a file server and the others diskless workstations.

Software lives on! As I recall the history, Robert took Braner's
original ETERNAL and modified it to make it easier to configure. I
believe he also tightened up the code to use slightly less memory.
The problem on the Mega 4 is probably due to the ramdisk reading the
first location after the top of memory to see if a magic number is
stored there, indicating an existing ramdisk. That doesn't work on
the Mega 4, so the strategy would have to be changed. Robert might be
willing to make the change and release a new version if there is still
interest in this program.

I have a question for all you loyal Atarians... "Why?" Why are you so loyal to Atari? I'm curious. I used to own a couple of 8-bits, and I was very happy with them. However, time marches on, and so does technology, and Atari does NOT seem to be at the forefront of consumer technology. Vaporware does NOT count. In any event, here in Berkeley, Winner's Circle sells both Amigas and ST's. Vincent, the ST guy, is so inthusiastic about the machine that he could almost sell me one.

What inspires such loyalty?

> pmb%swituc.uucp@arizona.edu
> KN7B @ WB7TLS.AZ packet radio

At one point DC SOFTWARE stated that RTS/CTS could be 'added' to their DC PORT pc board. I guess that this means kludging up a p[c board by adding chips, jumpers, etc. I, for one, don't wat to buy a hacked up pc board. And the idea of paying extra for hardware RTS/CTS seems kind of strange, almost like paying extra for the 1488/1489 RS-232 line drivers. I mean, RTS/CTS seems to be a basic,fundamental, part of the serial port design, and leaving it out makes me wonder where else DC SOFTWARE scimped to save money.

All in all, if DC SOFTWARE had asked before committing to a final pc baord, they would have KNOWN that hardware RTS/CTS is a requirement, and not just an afterthought. Heck, all of the FoReM ST BBSes are just crying for a working TOS with hardware flow control. The USR 9600 HST modem will xfer data at 14400 baud if you have hardware flow control. And just ask US Robotics about sells of the USR 9600 HST mdoem!! IT IS HOT!!!

So, I repeat, sell me a clean, nicely layed out, pc board DC PORT with hardware RTS/CTS, with software drivers that also support the hardware RTS/CTS and you will have one BIG market. If DC PORT worked at 38.4 KBPS with RTS/CTS you would have FoReM/USR owners begging for DC PORT.

I guess to summarize, I think that RTS/CTS should have been part of the basic design of DC PORT. I do not want to buy a DC PORT that was hacked up to support RTS/CTS. And DC SOFTWARE needs to provide system software drivers, which run on all version of TOS, to support the RTS/CTS signals. If DC SOFTWARE could do this, then the DC PORT would be a smashing success. Until then, I will withold ordering one myself.

Thanks for the forum to discuss this product.

>>so you are definetely not able to run a *secure* multitasking on this machine
^^^^^^^^ keep in mind
>> If you want to realize reasonable memory segmentation (in my experience this
>>is essential for TimeSharing) you MUST have a MMU.
>Oh really? Then how do you explain the appearance of Minix (a Unix
>look-alike) for the Atari ST?

But look at the performance of that multitasking system.
And, If I'd decide to write a real nasty program to run under Minix,
the chance is 99% that I crash the WHOLE system with this program. Myself,
I am a Minix user and I think I know what I'm talking about.

Conclusion : Minix is a very nice software to use it for learning about
time sharing, but it's useless for a *secure* (as I said above) every day
multi(tasking|user) operation because it is definetely not reliable enough.
You WILL have this problem with all multi tasking systems running on an
unmodified ST.
I think nobody would ever have the serious idea to use Minix to run an
open access machine, for example, even if the hardware was sufficient (dialup
lines, fast disk for the non-existent Minix swapper etc.).

913. Re: CMI Accelerator Board

Newsgroup: comp.sys.atari.st
Date: 1989-08-07 17:42:49 UTC
From: dclemans@mentor.com
Message-ID: <1989Aug7.174249.3330@mentor.com>
Source record: 248936

I can report a success story at installing the CMI accelator board.
This was done to an original style 520st system (board rev. E) using
the socket method (i.e., I didn't piggyback ontop of the 68000 chip).
You do need flywires, as the previous messages have stated; you need
the bus control & clock signals generated from the circuitry on the
board, and not the ones directly from the 16mhz 68000 chip.

One question... the red fly-wire, documentated as connected to R4
on the 520st, and un-connected on the Mega-st... what is its purpose?
At least for me, the board seems to work regardless of whether or not
the red wire is connected. My copy of the st schematics (which admittedly
might not match the motherboard revision I have) shows R4 as being in
the midi data current loop circuitry.

A note on the manual... the way I read it it implies that you get 16mhz
operation by closing the jumper, and 8mhz by leaving it open. However
on my system it's just the opposite; 8mhz when the jumper is closed,
16mhz when it's open.

A couple of final questions?

What are the recommended parts to use the fastrom sockets directly on the
board?

What is the definition of the "expansion" pins?

|
|I screwed up in my download of emacs (I shall try it again soon) and
|somehow the download seems to have created a file which TOS thinks is
|a volume label.
[]
|Question for Atari: How can something like this get there in
|the first place?

Using the Fattrib() call of GEMDOS you can make an ordinary file into a volume label. It's even worse: you can make it into a directory that is not really a directory (it doesn't have the . and .. entries, and you can't put files into it, but it _looks_ like a directory, since it has a 'mode' of 0x10).

Try and replay with:

```
if (Fattrib(filename,1,mode) < 0) {
fprintf(stderr,"%s: cannot set mode\n",filename);
}
```

with mode set to 8 for a volume label, or to 16 for a directory.

Leo.

P.S. On a side note, all GEMDOS documentation I could get hold of says about bit 5 of the mode (0x20), that it is used to indicate that a file was successfully written to and closed. I have yet to encounter such a file (hmm, doesn't that imply all writes failed ? 8-). However, it is possible to set this bit in the mode by hand (using Fattrib()).
Perhaps someone at Atari can say something sensible about the use of this bit?

|seeking to the desired position and issuing a write of 0 characters.
|It's worth a try...
|
|Kenneth Herron

Alas, it won't work, or better: fortunately. If such a stupid system design had been made, you had to check all your ordinary writes for zero-length writes, perhaps by writing a wrapper for Fwrite(). This really ought to be a separate system call a la BSD fruncate() (now I remember System V Unix also did something special with zero-length writes, but memory fades here).

The file's length won't be affected (using Fopen with either mode 1 - writeonly - or 2 - read/write). And if you issue a write of > 0 characters, those characters will replace the ones already there in the file.

There is one situation in which you can truncate a file, that is to length zero (using the Fcreate call). This is faster than explicit removing the file first (so my documentation says).

Leo.

Source record: 248943

Firstly, thanks for the considered nature of the responses. After reading them and pondering awhile, I have a few points to add.

Firstly, I won't be getting paid for the usenet articles in STWorld. Two factors operating here --- I wouldn't be adding anything of value, except a filtering function and discussions in news.admin convinced me that this wasn't enough to warrant payment --- and it would rather be an abuse of the usenet feed provided by HP for business purposes.

Secondly, I reckon that UK STWorld readers would be more interested in the strictly technical contributions rather than the discussions. I would much rather steer away from contentious issues --- and so would STWorld I would imagine.

Thirdly, "editing" in this context would be providing some introductory commentary to a coherent notestring, or selecting the most pertinent contributions to a particular string. I would hesitate to edit directly the contributions. As Greg pointed out in his email response, it's difficult enough making oneself understood on the usenet without being misquoted or quoted out of context. Looks like maintaining the integrity of contributions is worth making a central objective.

Thanks again for the guidance.

Cheers,

Graham

Thanks to those who responded to my query about >81 track disk drives. I'm currently debating if the track indicator is worth the extra $50.00 on a GTS-100. (but oh how I love little flashing lights! :) I'll probably end up getting the 1st Stop drive kit. IF ANYONE HAS HAD ANY TROUBLE WITH THESE *PLEASE* LET ME KNOW.

As for the floppy de-fragger.....it's a little silly to bother with. But if you insist why not just copy all the files to another freshly formatted disk? It's as easy as any other solution. It's only 800K for pete's sake!

(This same article could be posted before. If so, sorry. We have had problems
on this system here, so that I'm not sure.)

In article <426@brazos.Rice.edu> rhode@ricevm1.rice.edu writes:
>720k is a standard (IBM-compat.) disk format, so I assume Atari was simply conforming to
the industry standard. For example, I was unable to get a PS/2
>to format a disk to 820k, but I format them to 720k all the time - for media
>transfer purposes. The PS/2 won't read disks formatted by my Atari, but my
>Atari will read disks formatted by the PS/2.

But this has nothing to do with the format of your disks but only with that
ATARI's GEM Desktop does not format the disks in 'real' MS-DOS/PS-2 compatible
format (the boot sector has not the 100% data format expected by MS-DOS).
In TOS 1.4, as I know, this problem is solved. Finally.
Media portability should not be a problem while using so-called 'fat' disks,
if your formatting program will set up consistant data structures representing
this disk (boot/configuration sector, SAT, root directory etc.) Other OS's
should be able to handle this if they are following their own guidelines.
Definetely, a disk format bigger than 720k is not a non-standard disk format
at all. The only problem you could have with this is a decrease of reliability
and/or I/O performance. But this depends on 1) what media you're using (in my
experience, noname disks always are not that reliable) 2) what disk drive
you're using (maybe your disk drive spin frequency is too high so that you
can't write 11 sectors per track because then the 1st sector would be over-
written by the 11th. Of course, this problem would also appear while writing
to a 11sec disk coming from another machine bacause, while writing, TOS's
interest only focusses on what the configuration information of that disk is.
This could damage data. Besides, I would not recommend formatting disks with
more than 83 tracks on origional ATARI disk drives (SF354/SF314) because this
could cause the R/W heads to bounce against the slide boundaries. If this
happens frequently, this could dis-align or -even worse- severely damage your
drive.).
Concluding, if you have important data to store on your disks, I would re-
commend to use data compression instead of fat disks.

RE: TOS marking bad sectors.

Over the past three years I've had a number of floppies with bad sectors. In all of the cases TOS reported less than the expected number of free space after a desktop format. While it's true that it didn't say "XXX BAD SECTORS FOUND" the <358K available was a big tipoff. I'm not a programmer, but common sense tells me that TOS *did* know about the bad sectors.

From: TK0GRM1@NIU.BITNET
Message-ID: <8908072050.AA00576@ucbvax.Berkeley.EDU>
Source record: 248948

Ignac - Well, I've tried QuickST 1.46 (I believe that's the
version number...it's the auto-folder version you posted here.
I've since trashed my copy so I can't verify it) with Flash 1.6
and it STILL doesn't properly support VT100/ANSI screen codes.
For example, getting a CLS code causes the Flash status line
to vanish, and the text inversion to reverse. Additionally,
the arrow keys seems to be screwed up. This was on a mono
monitor...but I doubt that makes any difference.
On a more positive note, the speed increase on the GEM stuff was
just great! I was really hoping that I could use the program, but
until it will work properly with Flash I'll have to avoid it.
Keep yer chin up!

Message-ID: <44e4b105.14a1f@gtephx.UUCP>
Source record: 248950

Mark Williams Corp (mwc) offers the source code to their Standard
Library package for the Atari ST. I am a registered owner of MWC C (version
3.09 in fact) and I received a flyer last Feb. MWC was then offering the source
code to teir library for a low price of $99.00, for alimited time. By the time
I decided to buy it the offer had expired. Rats!!

Well, last week I got another flyer from MWC, this time offering a neat
little extended (unlimited they claim!!) precision binary, programmable, calculator.
Well, I don't know if I really need the calc, but it is being offered, for a limited
time, for $24.95. After Sept it goes up to $49.95, or something. I then noticed
that MWC has another offer. If you purchase BOTH the calc and the Source Code to their
Library, you get BOTH for $89.95! Now thats $10.00 less then MWC's initial offer
for the library alone last spring!!
So, I sent MWC a check!! I'll let everyone know how the code looks once
I get it.

Live long and prosper MWC!!!

At the risk of dating myself, the multitasking discussion reminds me of the CP/M hard disk wars. At the time, ST506 (5Meg) hard disks were real high tech, but most users had a pair of double sided 8" floppies giving them 2.4M of removable storage. People with floppies would always argue how useless a 5Meg drive was, they could replace entire development systems by just swapping a floppy. And floppies naturally organized their data into generic chunks. The hard disk users would crow about "high speed access" and having several editors available without having to change disks. The fact of the matter was, both were right and both were wrong. Most dedicated floppy users become convinced after a using a hard disk for a while that it is the greatest thing since sliced bread ('til it crashes of course! :-)) and most people using single tasking OS's find uses for multitasking OS's and after a while can't live without them. In another 5 years when the standard micro is a '030 or '386 based box with an MMU it will be the rarity that you _don't_ have a multitasking OS. But in the mean time, OS's are OS's. If they do the job, then like the 8" floppies before them they are not worth arguing about.

Amen to that! Amiga owners have suffered with the lack of an MMU. The
usefulness multitasking is a given, IMO. The security of Amiga's multitasking
is poor due to the lack of memory protection supplied by an MMU. Those of
you who agree multitasking is useful, and would like to see it on an Atari:
Demand it from Atari and demand MMU support as well.

I've constructed RAM boards using .01uf per memory chip, but I usually use
0.1 uf. It is usually the number of outputs on a chip that determine the
power glitch during switching. A single bit ram needs less bypassing than
a ram with 8 data lines. But 0.1uf should be fine for your purposes.
Keep the leads short! And keep the caps near the chips. Everybody sells
0.1uf caps!!!!!!!

They are indeed to suppress ringing, and they do it by restricting the transition current. You see, when a voltage changes (a logic level shift) at one point, it moves down the wire at the speed of light. So for those first few nano-seconds, the driver is pumping current into the wire, not by the load that is in on the wire further down, but by the limiting factor of the wire itself. Only after the signal propogates to all parts of the wire and reflects back (caused by electron pile up on dead ends) does the wire calm down to supplying the "real" load current. If the wire is pretty low impedence (a term than takes into account resistance, capacitance and inductance) a lot of current gets sent down it. Eventually the current will hit the end of the wire and, being only lightly loaded by the dram chips (that is one of the problem/features of drams, they make them light loads so they can stick a zillion on the same address line without bogging it down) the current has nowhere to go, so it reflects back toward the source. This oscillation will die down, and a resistor in the circuit would help disapate the oscillation more quickly. BUT, if you stick the resistor right next to the driver, in series with the wire, then the drive will see that the wire/resistor combo has higher impedance, so it will not send as much current down the line in the first place, and so reflections will be smaller, and hopefully not cause signals to jump in and out of their logic level ranges.

> and the Mega.

Since the drams are such a light load in comparison to 33 ohms, there is no need to adjust the resistors. The resistance is not critcal, any resistance helps, but too much resistance could eventually attenuate the signal. I'm not sure what the value would be, to be too high, but probably a couple hundred ohms. (since the drams don't need much current, but other chips on the board might need more, especially if they are TTL type loads, which are hefty compared to drams.)

Oh, I fogot. Another reason to use such resistors is to cut down on system generated EMI (electro-magnetic interference.) All this electronic equipment has to meet FCC EMI standards -- and every little bit of attenuation helps.

It stands to reason that if less current initially flows, and ringing is less, then less EMI will be radiated.

>you have a 68030 and a co-processor or a 80386 and a co-processor, it ain't
>worth worrying about for 99% of the users.

Well, for comparison, a Sun-2 (or Sun 100U) uses a 10 Mhz 68010, which is
not a quantum leap ahead of the 8 Mhz 68000. It runs SunOS 4.0, which many
readers may recognize to be a performance limiter, especially compared
to previous versions of SunOS. This system is in use at home right next
to my ST. Even with the overhead of multiple processes and limited memory
(Sun states that 8 Meg is the bottom limit in a useful system, I have
6 Megs), the Sun-100U is still performing useful work every day.

Don't belittle the 68000, it is not a slow processor by any means. What
you are noticing is poorly written systems software (ie, TOS & GEM). As
the QuickST code demonstrates, the code in ROM is not incredibly optimal.
What I am getting at is the ST, with a well written OS, could indeed
execute multiple programs concurrently and do it well. The problems
are not processor speed, but memory protection. Virtual memory is nearly
impossible (on the 68000, not the 680[1234]0).

Comments? Flames?

Cheers!greg (greg@cheers.UUCP, cheers!greg@lll-winken.llnl.gov)

Actually, he did say SECURE multitasking was not possible. i.e. One process address space is not protected against another process writing all over it.

Yes, sure, if your problem is I/O limited, more disks will help;

our main problem (molecular dynamics simulations of liquids) is not :

a few numbers in, a few numbers out (except for any tempory files, to
allow for recovery from power outs, etc) - on a Vax 750, nearly single user,
it was about one new point on the graph per week.

for moderate amounts of data, the problem can be managed; consider :

We usually boot a 2Mbyte MWC ramdisk into a Mega4's memory, at power on;
this gives us the Helios OS, resources, libraries, etc on ramdisk.
The transputer network boots from this; any parts or the network that
need to be booted/rebooted later can come up fast from this.

The rest of this ramdisk (and the ST4's menory) can be used for data,
and each processor has at least 1M of memory, some of which can be used to
squirrel data away on (preferably where it will be needed). If there are
multiple STs, these drives can be used. The local drive is assumed, unless
otherwise specified. Yes, sure, it is possible to get confused as to what
is where (ever done a recursive directory listing on a network of Suns?), but,
as always, placing the data where it is needed is the best strategy. Oh, and
yes, the fastest way of processing a small amount of data is to give each of
the processors that is to work on it, its own copy. We actually use something
called a systollic loop - there are two copies of the data, and one circulates
round and round a `race-track' of processors, getting modified as it goes.

P.S. anyone up to writing an eternal ramdisk bigger than 2M.
(preferably that can be resized without rebooting)
Ah, well, one can always hope !

I should be on holiday, I am writing too much.

cheers,
beau webber ukc.ac.uk

943. Re: Julian date

> ^...! (stuff deleted)

This is not quite true. The base date of the Julian day number is
Jan. 1, 4713 BC (or -4712 since the year 0 does not exist in the
historical year count). And there is of course a reason why Joseph
Scaliger (1540-1609) choose this date:

(I have to use some specific words which I don't know a correct translation
of, thus I give the german original in parentheses. What follows is taken
from the book "Bekanntes & Unbekanntes aus der Kalenderwissenschaft" from
Heinz Zemanek (IBM Fellow and Prof. at the TU Wien), R. Oldenbourg Verlag,
Muenchen 1978; and it's long ...)

Sun Circle (Sonnenzirkel) is a cycle of 28 years since every 28 years the
same dates are on the same week days throughout the year. (4 leap-year
cycle times 7 days per week.) It is defined as SC=(year+9)%28 (% is the
remainder operator as in C). I don't know the reason for the +9 offset.

Moon Circle (Mondzirkel) is a cycle of 19 years, also called the Meton
period, because Meton suggested in 433 BC to use 12 years with 12 months
each and 7 years with 13 months (months have 29 or 39 days), after which
dates could repeat without too much difference against the astronomy.
The Christian church used the Moon circle for the computation of the
Easter date. It is also called Golden Number (Goldene Zahl) and is
defined as GN=(year+1)%19.

These two cycles multiplied give 532 years, the so called Easter cycle,
because after that time every Easter sunday would have the same weekday
(without considering a slight shift called "Epakte").

The ancient romans had a cycle of 15 years, after which time a new tax
count had to be made. It is called "Indiktion" (from latin: indictio,
decree or order), was also used for other purposes (which?) and is

defined as IN=(year+3)%15.

Now Scaliger multiplied the length of the Easter cycle with the indictio, which yields 532*15=7980 years. He also found an epoch, such that every year gives the right SC, GN, or IN remainder when divided by 28, 19, or 15. And this epoch is Jan. 1, 4713 BC (you guessed that already, didn't you?). It's also true, that this is a convenient date for all historical purposes.

Example: 1989 has the SC: 10, GN: 14, and IN: 12 (as of the above formulas). 1989+4713 = Julian Year 6702, divided by 28 or 19 or 15 gives the same values for the remainders (without formulas).

By the way: The present Julian day is 2,447,747 = Aug. 8, 1989.

There is more to say about this, but I don't think it belongs to this group. Thank you for reading this far| Your reward:

Here is a piece of a program to compute the date of Easter sunday for any given year (don't know what happens for years BC, not reasonable anyway) which I made some time ago. It is slightly modified from a formula from Carl Friedrich Gauss.

```
++++++++++++++++++++++++++++++cut here++++++++++++++++++++++++++++++++++
/* Compute the date of Easter sunday for any year */
/* Based on the formula of Carl Friedrich Gauss */
/* Cornelius Caesar February 22, 1988 */
void easter( year )
int year;
{
int month, day, a, n, m;

if (year < 1583) {
n = 6; m = 15; } /* switch to julian calendar */
else {
n = year/100-year/400+4; /* switch to Gregorian calendar */
m = n-year/300+11; }
a = (((year%19)*19)+m)%30;
day = (((year%4)*2+(4*year)+(6*a)+n)%7)+a-9;
if (day<1) {
month = 3; /* March */
day += 31; }
else {
month = 4; /* April */
if ((day==26) ((day==25)&&(a==28)&&((11*(m+1)%30)<19)))
day -= 7; /* correction: one week earlier */
}
printf("Easter sunday is %d/%d/%d\n", month, day, year);
}
++++++++++++++++++++++++++++++cut here++++++++++++++++++++++++++++++++++
```

This looks somewhat cryptic, but it works and is useful for calendar programs. Gauss took a base date (March 21, 1700) and from this adds

the required number of days depending on some other formulas (the above mentioned Sun Circle and Golden Number and "Epakten" and others; it is explained in the reprint of his papers).

I just compacted his description for use in a program. INT's need only be 16 bit wide. Hopefully somebody likes it|

Cornelius

944. Atari SLM 804 laser printer

Newsgroup: comp.sys.atari.st
Date: 1989-08-08 12:40:46 UTC
From: jansteen@piring.cwi.nl
Message-ID: <8320@boring.cwi.nl>
Source record: 248867

I have some questions about image formats and the Atari SLM
804 laserprinter:

I. What does IMG image format look like.

II. What does IFF image format look like.

III. How does one send an NxM bit image to the SLM printer.
Think of Degas format, but in my particular case much
bigger.

IV. The local Atari dealer told me that spooling to the laser
printer involves writting assembler code to access the DMA
port. Does anybody have written this code, or written
a higher level language (C) library routine.

>> both, hundreds of milliseconds will elapse between the user's keypress
>> and the resumption of execution of the foreground task. Thus, the
>> user will perceive a very sluggish response from the foreground task.
>>

From The Amiga ROM Kernel manual:

Every task has an assigned priority and tasks are scheduled to use the
processor on a priority basis. The highest priority ready task is selected
and receives processing until:

1. A higher priority task becomes active.
2. The running task exceeds a preset time period (a quantum) and there
is another equal priority task to run, or
3. The task needs to wait for an external event before it can continue.

Task scheduling is preemptive in nature. The running task may lose the
processor at nearly any moment by being displaced by another more urgent
task. Later, when the preempted task regains the processor, it continues
where it left off.

When a higher priority task becomes active, the running task is immediately
interrupted. A task would become active if, for instance, it was waiting for
a key to be pressed and the user pressed one. There would would be no
degradation in response by a CPU intensive task if that task has a lower
priority. Time slicing occurs only within groups of equal priority tasks.
In fact, if a CPU intensive task was a higher priority task than other tasks,
those tasks would be starved by the CPU intensive one.

Last night I ran a raytrace at a lower priority than my Command Line Interpreter and saw no performance degradation. Even when I just mashed my hands down on the keyboard there was no sluggishness.

947. GDOS, OPUS and BSTAT

Newsgroup: comp.sys.atari.st
Date: 1989-08-08 14:12:58 UTC
From: CHIASSA@UDEM.BITNET
Message-ID: <ID6442.D890808.T111258.CHIASSA@UDEM>
Source record: 248870

Having tried to get OPUS and BSTAT to work with GDOS has left me with a few questions concerning GDOS font management. OPUS documentation pointed out that the ASSIGN file of TIMEWORKS DESKTOP PUBLISHER has screen fonts that are not listed in the printer fonts. I ckecked and yes this is true! Not only that but among all the screen and printer fonts listed only two matched up regarding font type and point size. What happens when the program tries to do a print with a screen font that has no matching printer font, or the case where there is a printer font but the wrong point size?

Both OPUS and BSTAT look great though the latter replies better to my needs. I work in french so I often need access to the different accents which I do with a program that I run from the auto folder. OPUS acknowledges whatever the accent program does (keyboard interupt?) but BSTAT does not. What determines if a program does or doesn't respond to programs that give access to foreign characters? Can I do something to get BSTAT to accept french accents? The only thing I find lacking in the graph features of both programs is subscript and superscript for scientific labels. I am current designing some greek letters with FONTZ! but I would like to be able to place them in either superscript or subscript position.

948. IMAGE SCAN and bplfactor

Newsgroup: comp.sys.atari.st
Date: 1989-08-08 14:28:26 UTC
From: CHIASSA@UDEM.BITNET
Message-ID: <ID6466.D890808.T112826.CHIASSA@UDEM>
Source record: 248871

I have the latest version of IMAGE SCAN which supposedly permits scanning at horizontal resolutions of 75, 150, 216, 300, 360 and 1000 dpi. I have tries 360 dpi on both my NX-10 (Star) and NX-2400. At 360 I get a condensed blob on the screen. When I try to print it out using TIMEWORKS DESKTOP PUBLISHER with the 360 dpi fonts I get a condensed elongated blob on paper. Other IMG file print out fine. I suspect the configuration file and what is called the "bplfactor". Does anyone know what this means and how it relates to specific printer commands?
For the GEMNI10X.CDS it lists bplfactors of 166 for 75 DPI, 81 for 150 DPI, 53 for for 216 DPI, 39 for 300 DPI, 31 for 360 DPI and 10 for 1000 DPI. I assume this should also work for the NX-10 but it doesn't. I have written to the company ages ago but they never replied. There is no information in the readme file to explain.
By the way I was doing the printing with the NX-2400 which can do 360 dpi but it is easier to attach the cable to the NX-10.

949. my prev. message; and: struct iconblk ???

Newsgroup: comp.sys.atari.st
Date: 1989-08-08 14:33:00 UTC
From: FM@DACTH51.BITNET
Message-ID: <8908090814.AA21686@ucbvax.Berkeley.EDU>
Source record: 248872

Ok,Ok, Now I know the routing of my messages is O.K. and You all know I sometimes make typos somewhere. Thanks to all You who corrected me. Surely noone could have guessed the meaning of the mistyped sentence. I can't include former postings here (cant't persuade this $#@* VAX not to send them to the original sender but to the gate at Stanford), and I'm not going to cite my sentence. Those who know, know, and the others didn't miss anything.

Now to the more serious second subject: I've spent a weekend programming some Icons, and discovered a undocumented feature. Undocumented? I have three different GEM - Programmer's Guides, one very recent ("Atari ST Profibuch") and noone mentions the thing -- but sure at least the people who build Resource Construction Kits will know this.
All my documentations tell that the struct iconblock looks like

```
struct iconblock {
...
int ib_char; /* Letter in Icon, e.g. in Disk-Icon */
...
} ICONBLOCK;
```

(include a 'typedef' above, I forgot it) and this is how the obdefs.h - files look for every compiler I looked at. BUT -- Say, I have an icon OBJECT *the_icon; , then the statement
the_icon->ob_spec->ib_pchar = 'A';
leads to an Icon painted white on white. Not useful. In fact, Icons construed with a RCK look like:
the_icon->ob_spec->ib_pchar == 0x1000 + 'A';
I tried this, and it worked. It took me 1 1/2 days to discover that the fault was not in my pointer forest. Obviously, the ib_char hides in some way the colour of the icon. I didn't try, how this is done, I guess the two nibbles of the high-byte contain a number between 0 and 15 each, coding foreground and background? I'm glad to have my icons working now. But I got very angry because this was not mentioned in any of my books!

Oliver Bonten

Surely it should be called LOADUP.ELC if it is compiled ?? On my Sun
system here I have both LOADUP.EL and LOADUP.ELC. LOADUP.EL is printable.
LOADUP.ELC is a binary...

>wonder where else DC SOFTWARE scimped to save money.
>

1) *ALL* DC-PORTs are guaranteed to be from defects for a period of ONE YEAR
after purchase. Let's see you get that from anywhere else!
2) A hacked up PC Board? Unless you call a couple of jumpers hacks, then you
don't know... You can have two choices if you want rts/cts, you can go
without dcd/dtr and get rts/cts, or we can add a daughter board to add
rts/cts to the existing board.
3) SKIMP? If you went to manufacture one of these babies, then you'd know
that we designed it to keep cost down, and within the reach of most people.
Since we are not a large company (actually college students) and we do not
have endless cash flow, we went with the needed components to get our
hardware working with the majority of software existing. We do not skimp!
Our boards are 100% certified working, and carry a one year guarantee. Our
drivers work as advertised, and all our customers thus far are satisified,
in fact, several are upgrading to the five line version.

> All in all, if DC SOFTWARE had asked before committing to a final pc
>baord, they would have KNOWN that hardware RTS/CTS is a requirement, and not

>sells of the USR 9600 HST mdoem!! IT IS HOT!!!

You mean we should have asked you! As far as the USR modem is concerned, we admit that it will FLY with rts/cts, but it is not a requirement for it to work, and the *majority* of people out there do not own them, nor do the majority of BBS out there have them.

As far as FoReM is concerned, we tried working with Matt Singer to get an update to FoReM to support DC-PORT and make FoReM multi-user. He never said nor expressed any concern about the rts/cts lines. He has our port now, ask him what he thinks on the matter!

>
> So, I repeat, sell me a clean, nicely layed out, pc board DC PORT with

>basic design of DC PORT. I do not want to buy a DC PORT that was hacked up to
>support RTS/CTS. And DC SOFTWARE needs to provide system software drivers, which
>run on all version of TOS, to support the RTS/CTS signals. If DC SOFTWARE could
>do this, then the DC PORT would be a smashing success. Until then, I will withold
>ordering one myself.

In other words, one sale to you is a 'smashing success'? Why don't you spend some time and money on a market survey, and determine whether or not the ST market can handle a higher priced expansion port! We are selling them as fast as we can make them, and have not had one returned, nor have we had any dissending comments. We have made special order versions, and have done our very best (considering our limited financial backing - read 'shareware contributions') to come out with a product that fills *most* peoples needs.

Our driver does *work* with ALL TOS versions, and works as advertised.

I assume you are speaking from experience with DC-PORT, and have actually seen one close up, and have actually voided someone's warranty by opening the case!

You have no idea how much we would charge for the version which supports rts/cts, since you never called or wrote to ask, and as I stated twice before, *ALL* DC-PORTs come with a ONE YEAR warranty.

Why don't you speak to us in person to find out how easy we are to work with, rather than getting 'modem-mania' and flaming our product (which I am sure you have never seen) on the net.

And, by the way, we are working on a DC-PORT II, as well as another hardware product, DC-TALK.

Give us a call, and see if it is as easy to flame us on the phone as it is on the net!

>
> Thanks for the forum to discuss this product.

Quite sure. It shows up with the v flag set (meaning volume label) when I do a 'ls -la' from msh.

I'm not having much luck in solving this problem. If I can't get my hands on a sector editor in the next couple of weeks I will likely just zero the entire partition and restore it from the backups (Here's hoping turtle works :-).

Date: 1989-08-08 17:14:46 UTC
From: landry@enginr.dec.com
Message-ID: <3958@shlump.nac.dec.com>
Source record: 248878

In article <1534@ns.network.com>, logajan@ns.network.com (John Logajan) writes...
"willing@ICSL.UCLA.EDU (Scott Willingham) writes:
"> Does anyone out there happen to know the optimum decoupling
"> capacitor value for 1Mbit DRAMS? If so, do you also know of a
"> good supplier for them?
"
"I've constructed RAM boards using .01uf per memory chip, but I usually use
"0.1 uf. It is usually the number of outputs on a chip that determine the
"power glitch during switching. A single bit ram needs less bypassing than
"a ram with 8 data lines. But 0.1uf should be fine for your purposes.
"Keep the leads short! And keep the caps near the chips. Everybody sells
"0.1uf caps!!!!!!!
"

This isn't quite true! The decoupling needs of dynamic RAMs
have little to do with the output drivers. By far the
biggest current changes occur when RAS turns on and off, not
when the outputs are enabled.

0.1 uf caps are fine for decoupling 64K RAMs but 0.33 uf caps
(multilayer ceramic) should be used for 256K and larger devices.
AVX has a technical report that shows there to be quite an
improvement in power noise by going to 0.33. At first we
thought it was AVX marketing trying to sell us their new small
0.33 caps so we repeated the tests on our own memory boards.
Turns out they were absolutely right!

Here are some numbers out of their report (for 256K RAMs):

cap value(uf) total voltage drop (mv)

0.068 130
0.1 115
0.22 95
0.33 85
0.47 80

(Diminishing returns above 0.33)

chris

956. ATW - Atari Transputer Workstation

Newsgroup: comp.sys.atari.st
Date: 1989-08-08 17:21:49 UTC
From: dyer@math.lsa.umich.edu
Message-ID: <766@stag.math.lsa.umich.edu>
Source record: 248879

My roommate went to Siggraph last week and all he brought me back was this stupid ad... :-)

Reprinted without permission. No guarantees of typographical accuracy or truth of posted ad. In short, its not my fault!

Atari Transputer Workstation -- Specification

Processor: Main Processor T800-20 (20 Mhz), the T800-20 can perform 10 million instructions per second (MIP), has 4k on chip RAM and a floating point arithmetic processor.

A 68000 (8 Mhz) processor relieves the T800-20 of all I/O tasks to be performed. The 68000 I/O subsystem is connected to the T800 via a transputer link, communicating at 20 Mhz.

Memory: The T800 has access to 4 Megabytes of fast dynamic RAM (120ns), which can be expanded internally to 16 Megabytes (and eventually to 64)
The 68000 I/O subsystem is supported by 512K RAM, which can be expanded up to 4 Megabyte. [sic :-)]

Video Memory: 1 Megabyte of fast dual port dynamic RAM (100ns), ports connected to both the main bus and video bus.

I/O: All I/O is the responsibility of the 68000 I/O subsystem. This subsystem is based on the Atari Megs ST specification and is able to function independent of the host T800 system. The following I/O is supported via the 68000 I/O subsystem.

RS232, DMA, Parallel port, Midi ports, Floppy Disk (3.5 or 5.25), SCSI, Mouse or Joystick port.

All standard Atari ST range peripherals can be connected. The 68000 subsystem will be capable of supporting its own RGB or composite monitor independent of the main system monitor.

Storage: The ATW will be supplied with a 40 Megabyte SCSI hard disk. Additional or higher capacity drives will be available as options. [on the copy I have, the 40 was crossed out and an 80 was written in]

Video: The ATW will support the following screen resolutions:

Mode Resolution BPP Colours Pallette
0 1280x960 4 16 4096
1 1024x768 8 256 16 million
2 640x480 8 256 16 million

3 512x480 32 True colour

The graphics processor (called "Blossom") relieves the T800 of memory refresh and data transformation between address spaces. The graphics processor is capable of addressing the entire user RAM area in addition to the video RAM.

Additional graphic processor specifications:

Functions designed specifically with X-Windows in mind:
32x32 pixel mask. 16 bit wide functions on source and destination. 4 linear comparisons on each pixel per cycle. Square area fill up to 32 Mpixels/sec. Line drawing up to 32 Mpixels/sec. Trapezoid fill up to 32 Mpixels/sec.

Expansion: Both the main T800 system and the 68000 I/O subsystem can be expanded : The 68000 bus is available for expansion via 1 slot. The T800 bus is available for expansion via 4 slots.

The T800 expansion slots will support additional transputers and RAM. The T800 bus is also available for adding support cards such as X25, Ethernet, Link X-Bar switch (based on C004/T212). Upto 12 additional T-800-20 can be added to the ATW. There is no limit to the numbers of processors that can be added externally.

Operating System: The operating system, Helios is a true distributed operating system. There are no central services upon which the entire system relies, thus making the system more fault tolerant. The distributed nature of Helios is transparent to both the user and programs.

Helios is multi-tasking and designed specifically for a multi-transputer architecture. The Helios environment, with its C shell and UNIX compatible command set and libraries will be familiar to all UNIX programmers and users. Helios is responsible for distributing program components to the appropriate processor in the transputer network.

Languages: The ATW and Helios support all major languages including: C, Fortran 77, Modula 2, Lisp, Prolog, BASIC, Occam, Strand.

User Interface: X-Windows Version 1.1 runs on Helios. The X-Window system is the standard for controlling window based graphics on workstations. It is flexible and powerful. A desktop representing data and facilities as icons will simplify the UNIX style interface of Helios. A mouse pointer will enable easy selection of icons and pop-up menus.

Whilst every care has been taken in the preparation of the information in this document, no liability is accepted for any consequences of its use. In the interests of continuing product development, the right is reserved to alter any details of specification or equipment without notice.

Atari Corp. (UK) Limited, Atari House, Railway Terrace, Slough, Berkshire SL2 5BZ. Telephone:(0753) 33344. Telex: 848401. Fax: (0753)822914.

The box itself looks like a cross between a Mega and an RT. The keyboard and mouse are Mega ripoffs. The CRT pictures says "NEC Multisync Plus". The Guts of the machine are in a stand-up box. From the picture, I'd guess that its about 1 foot wide, 1 yard high and 1 yard deep. The front of the box has some lights, a reset button, a disk drive (looks like a 3 1/2), what might be a 5.25 drive, and two key locks.

957. Game players survey

Newsgroup: comp.sys.atari.st
Date: 1989-08-08 17:24:03 UTC
From: steve@sunpix.UUCP
Message-ID: <748@greens.UUCP>
Source record: 248880
Cross-posted to: comp.sys.atari.st,comp.sys.amiga,comp.sys.ibm.pc,comp.sys.atari.8bit,comp.sys.cbm,rec.games.programmer

Here is a gaming survey my new partners and I put together. we are trying
to get a feel for the Computer gaming atmosphere to help us in producing
our first released game.
This survey will be held in confidence so please answer the questions
honestly.

I will post a summery to the news groups that show enough interest.

Thank you for your help
Steve
---
1. Do you play computer games (obvious question)

2. Do you play board games?

3. Do you play non-computer role playing games?

4. Of the computer games you play, do you play...

a. Role playing games (fantasy)

b. Role playing games (sci-fi)

c. Arcade type games

d. Strategic/tactical combat

e. Strategic/tactical sci-fi

f. Mystery/detective

g. Flight simulator/combat

h. Other type (please describe)

5. Of the above types of games what type do you play most.

6. On average how long do you play a game before shelving it
(how much playability is there in your games)

7. Do you have any games you purchased?

8. Do you have any pirated games?

9. Do you write your own?

10. Do you have mostly (a) purchased (b)pirated or (c) self made games

11. What is the most you spent on a game?

12. Was it worth it (in comparison to the price of other games)?

13. What do you think is a fair price for most games?
(considering packaging, marketing, royalties ect)

14. How often on average do you purchase games?

15. Do you have any PD games?

16. Have you ever sent any money on a share-ware game?

17. Do you play games mostly with other people or alone?

18. What attracted you to the last game you obtained....

a. Word of mouth

b. Reviews

c. Box art/game description on box

d. It was free

e. Other (please describe)

19. What do you think is more important in a game..

a. Excitement

b. Realism

c. Playability

d. Complexity

e. Graphics

f. Other (please describe)

20. What do you think is least important in a game?

21. What system do you play games on most?

22. Comments (or flames)

Message-ID: <1074@MSG002.UUCP>
Source record: 248882

I have been using the combined version of VIP for a long time now. The first version allowed only keyboard input, though the manual came out with both GEM and keyboard. With the exception of cell movement - once in a while - skipping the cell I'm trying to move toward, I'm pleased. I have heard about LDW, and the ones using it swear by it, but mine VIP is paid for. You might check with the VIP folks. When I got my upgrade, it was not very expensive.

960. DOS 3

Newsgroup: comp.sys.atari.st
Date: 1989-08-08 18:01:53 UTC
From: mfolivo@sactoh0
Message-ID: <1698@sactoh0>
Source record: 248883
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

I am primarily posting this to comp.sys.atari.8bit, but perhaps someone at Atari Corp who reads ...atari.st might help.

Probably being one of the last DOS 3 users in the Western World (not counting all the 8bits shipped to Poland (heh)) I have wanted to know the file structure, etc. of DOS 3. DOS 2 has been widely documented, but I have found nothing on DOS 3. The only technical information I have about DOS 3 is that the directory is on the first sectors (rather than in the middle of the disk- DOS 2) and that DOS 3 stores files in 8 sector groups called blocks (1024k).

Is there (Are there) any technical notes or source documentation or anything on DOS 3? Who wrote DOS 3? Was it in house Atari, or was it an OSS effort?

Please, no flames. I mainly use my Mega 4, I don't want to buy another DOS (read: from ICD), all my 8 bit files are DOS 3 (I tried DOS 2.5 but went back to DOS 3). I would like to have some background information on how DOS 3 works. (Bugs? What bugs? I certainly haven't found any bugs... ANd no one complains that GEMDOS (ST) uses 512k blocks...)

Mata ne da-cha,
Mark Newton-John

961. Re: Contribution copyright query

Newsgroup: comp.sys.atari.st
Date: 1989-08-08 18:18:24 UTC
From: andyc@hplsla.HP.COM
Message-ID: <5440045@hplsla.HP.COM>
Source record: 248884

*
*Apart from a complete rewriting of the contribution (at best plagiarism --- but
*the contributor *would* be acknowledged), how far can I go towards direct
*quotes/inclusion of text?
*
*I would also appreciate contributors' views on the ethics of this. I don't want
*to put people's noses out of joint, nor get anyone into bother with employers,
*hence this enquiry.
*
*----------

My reaction is, I'd like to be able to post to this notesgroup without
the worry of where else it might end up, especially if it is non-electronic
media. I don't prepare my postings with the care and broad perspective
I would use if I was going to write an article, and in general don't want
them used that way. Also, what with the vagaries of the US legal system,
I'm not enthused about my postings going on beyond notes without my express
permission.

(I've already been surprised about where my postings have ended up thanks to
the info-atari-16 digest, and have not always been happy at the requests that
have resulted).

I would note that usenet is not supposed to be used for deriving commercial
revenue. It's for communication. Re-packaging that communication and selling
it strikes me as rather similar to those folks that put shareware on a
disk and sell it for a service fee. That is, the ethics are questionable.

And if someone does turn a buck from usenet, I think that the universities
and companies that make usenet possible (e.g. pay its bills) are entitled to
the lion's share of the profit. (Not to mention any and all authors).

I would recommend that permission be obtained before using any material
posted on usenet in a publication. Maybe you could obtain blanket permission
from those Atari employees that regularly provide official technical
information.

Disclaimer/Copyright Notice: This opinions expressed herein are those solely
of the author, who has no pecuniary interest in the companies mentioned, and
who also happens to own the copyright to this posting.

962. Re: deskjet pageformatter

Newsgroup: comp.sys.atari.st
Date: 1989-08-08 19:15:21 UTC
From: neff@hpvcfs1.HP.COM
Message-ID: <2150014@hpvcfs1.HP.COM>
Source record: 248885

Regarding the DeskJet "pageformatter".

The DeskJet and DeskJet+ DOES NOT HAVE A PAGEFORMATTER. It never has, it never will. You cannot do random cursor positions on the page. In order to allow for mixed text and graphics the printers try to insure you can do negative cursor moves of the maximum point size of text, which is 2/3 of an inch on the DeskJet+ (36 point theoretical maximum font). Hence you can send 2/3 of an inch of text, back up the cursor 2/3 an inch and then send 2/3 an inch of graphics. The actual mixed text and graphics algorithm is more subtle and uses variable lookahead based on the actual point sizes used in order to give more reliable results (if there are lots of font/enhancement changes its not always possible to even back up 2/3 of an inch) but the above description is the basic concept.

Not only does the DeskJet and DeskJet+ not have a pageformatter it DOES NOT HAVE A BIT IMAGE BUFFER. Commands to print characters are sent to a custom IC, which looks them up in ROM and prints them. Hence two overlapping A characters are treated the same as an A character overlapping a B charater. THERE IS NO BIT IMAGE BUFFER WHERE CHARACTERS ARE SIMPLY ORED TOGETHER. This is the reason ink will puddle if characters are printed on top of one another.

The DeskJet and DeskJet+ printers lack a page formatter and a bit image buffer in order reduce the cost of the printer by reducing the need for RAM. We just need a couple K of RAM to build commands (or vectors) for the custom IC when then uses DMA to get the commands and print the text. The firmware never sees the bit image of the text. The firmware does see the bit image of the graphics but it is stored in a special form needed by the custom IC for printing the graphics and for this, and other reasons, overlapping graphics are not ORed together either. Notice that text and graphics are always printed in separate passes as a result of the lack of a bit image buffer. In some respects using a bit image buffer in the DeskJet+ would make more sense than the current scheme but it was leveraged from the DeskJet which lacked enough RAM for a bit image buffer (and the custom IC does not support a bit image buffer).

It's hard to be any clearer without going into much more technical detail but I hope this helps. The DeskJets have a "format buffer" which stores approximately 2/3 inch of text (and in the case of DeskJet+ 1/3 of an inch of graphics), not a page formatter. The DeskJets have a "vector buffer" (well, actually 2 such buffers) for sending commands to the custom chip, not a bit image buffer.

For more details about the inner workings of the DeskJet printers try to get the October, 1989 issue of the HP Journal. It goes into more detail on the above concepts.

Happy Printing,

Dave Neff

I was wondering, is the diff between the slower (i.e. Atari Megafile 30) hard drives and the quicker (28 ms) drives noticeable in day-to-day usage. I understand I can get a Megafile 30 for $499 and am debating about holding out for a faster (& more expensive) drive.

On another note, how about some reports on these 'Frog' drives :-} with the removable media. Fast? Reliable? Standard? Compatible (with Atari-'soon'-to-be-released-drives)?

Bill Hodges | Me? People who speak for the Air Force get

% HELP can launch all apps from one spot. This is GREAT.

You can get pretty much the same effect with NeoDesk. You can install the icon for a program anywhere on the desktop, as opposed to just dragging it around to another folder. NeoDesk remembers the pathname to where the program actually resides, and will set the default directory there when you click on the icon. Very handy, and it lets you keep all files associated with a single program in the same folder, which is nice when it's time to upgrade... (I'm using 2.0x something or other, not quite the latest, but pretty fun. And no relation to the authors or their company...)

I'm sorry to interrupt all the discussion concerning new corporations, NASA bashing, Satrun V mourning, and whatnot, but I have an actual question which I don't know the answer to, nor do I know how to get an answer. I think it's a non-library question.

My sister recently sent me a postcard from Washington (Air & Space Museum) It pictures 4 T-38's flying in formation with the NASA logo on their tails. The card says they're T-38 trainers used by NASA. She asked me, "Aren't T-38's the Air Force's? What is NASA doing with the Air Force? What does NASA use them for?"

My question is: What does NASA use T-38 trainers for?

Shuttle landing practice is done with some plane which was mentioned to me but which I can't recall the name of. (something Stream something maybe) (GulfStream? I don't know.)

Are the T-38's just used to keep NASA astronaut pilots with enough flying hours to keep "current"?

Are they involved in NASA's aeronautics research? If so, how?

I hope some of the Ames 'netters can answer this. Thanks in advance.

The views presented here are not those of my employer, but are solely mine. -Leif S. Kirschenbaum, Technical Associate, Lockheed Egineering

#>Richard (gtephx!covertr) Covert

I've been working with various terminals and computer systems for ten years now, and I am sorry to inform you that many major companies do _NOT_ agree with you. Some support RTS/CTS, some XON/XOFF, some both and some use kludged up combinations of both!! ATT does not support rts/cts on their 3B2 series, and Burroughs seems to only support RTS/CTS.

My point: the RS232 standard isn't. Please don't flame DC for implementing the portions that help the majority of their users. You might flame US Robotics for building a device that REQUIRES it to work right.

Does anyone know of any C compilers for the ST that support segmentation of large programs (i.e. portions of the program reside on the disk until they're needed).

Thanks

- Kent Schumacher /* "A member of STdNET- */

jjl@psuecl.bitnet writes...

> I have been trying to get my Sozobon C compiler to work for a while
>now but to no good end. Whenever I try to compile a program and type something
>as basic as cc nlp.c, it comes back with unknown file suffix "nlp.c" , why
>is it taking the whole file as the file suffix, any ideas?

The Sozobon cc.ttp program assumes that you use a command shell that can pass arguments unmangled. The behavior you describe suggests that your command shell is upcasing the tail (arguments). That's trouble -- cc is case-sensitive, and jas may be as well. You can NOT run cc from the Desktop.

(In a separate article, jjl@psuecl.bitnet writes...)

> Would anyone be kind enough to give me a little help with C here.
>I am using MJC and Sozobon C and have just used them for very primitive
>things... what I would like to know is if there are any calls so that I
>can reposition the cursor to any x,y coordiante on the screen.... and also
>if there is a way to plot individual poixels on the screen from a call.

To position the text cursor (not the mouse pointer!) you can use the VT52 escape code:

<esc>Y<row><column>

as in:

```
printf("\033Y%d%d", row, column)
```

Plotting individual pixels is another matter entirely. You can use the Line A graphics routines (in assembler), but there is almost no publicly available documentation on Line A. Your best bet probably is to use the VDI output function v_pline(handle, count, pxyarray) and plot a line with only one point.

> 0.47 80

Consider that the threshold voltages for TTL levels are 0.8 and 2.4,
and closer to the rails for cmos -- then the difference between
0.115 and 0.085 (.03 volts) doesn't seem so bad. I agree that the
noise margins are better for .33, but are they better enough?

As an aside, one our technology guys was telling me that bypass caps
of any size or type are virtually useless for eliminating the noise
components above about 300mhz. Fortunately most logic is more prone to
lower frequency (lower than 300mhz!) glitches than to higher frequency
glitches -- after all, if it could respond that fast, people would use
it in their Cray's instead of their ST's.

>
>On another note, how about some reports on these 'Frog' drives :-} with
>the removable media. Fast? Reliable? Standard? Compatible (with Atari-
>'soon'-to-be-released-drives)?

The faster drives are noticeably faster. If you are useing file based
based utilities such as arc, a compiler, MTC (a multi tasking shell), or
Minix you will notice a VAST improvement (about 4 times faster). Many
graphics programs also write to the disk often.

The FROG drive appears to be based on the Syquest drives. I have used their
10 meg disks, and find them to be usable, but pretty fragile. You can lose
a disk by dropping it 2 feet onto a desk. The ones I used were also VERY
susceptible to power hits. A 1 second outage was guaranteed to cause data
corruption. A suprising feature was that the drives also are sensitive
about their orientation. They don't work well on their sides.

Keep in mind that it is a hard disk, and the heads can crash just like
those with fixed media. If you make the mistake of putting a crashed disk
back into a drive you might end up with a bad head which will trash any
other $100 disks you insert afterwards.

Don't get me wrong though. As soon as I can get a hands on demo I plan to
consider the purchase my-self. It would be great for setting up a development
disk, a MAC disk, and a dos disk without fear of accidently corrupting each
other. I am aware of the risks, and can be careful enough to reduce them
to a reasonable level. Who knows, they may have added auto parking, power
tolerance, enhanced quality control and all the other things a personal
computer user needs :^).

977. Archive bit

Newsgroup: comp.sys.atari.st
Date: 1989-08-09 11:11:44 UTC
From: SQ79@liverpool.ac.UK
Message-ID: <8908091359.AA08065@ucbvax.Berkeley.EDU>
Source record: 248900

Bit 5 of a file mode is the archive bit. This is to do with backing up files. When a file is backed up it's archive bit is set. When it is next written to the bit is cleared. From this senario the disk back up program can tell whether a file has been modified since the last back up and if so back up the file otherwise leave it. This enables an incremental backup to be performed i.e. back up your hard disk totally every month, and backup just the files that have changed every week. Unfortunatley this procedure doesn't work on the old TOSes (or so I'm informed) TOS 1.4 is said to fix this.
I have seen plenty of files on my disks with this bit set. You may be running a different TOS from me though. I've got a UK TOS 1.0 dated 20/11/85 i.e. 20th November for you in the US who don't put the date in ascending or descending order of significance (make your minds up!)

Please help me !!!

I've bought a 360KB 40 tracks SD/DS IBM compatible diskdrive model RFD480 from Ex-Cell-O Corporation (REMEX Division). But I have no documentation and no wiring diagram of it. I want to connect it to an ATARI ST Computer.

My first question is about a jumper-block of 4 jumpers (A,B,C,D) and their functionality. This is not the jumper-block for the device-select signals.

My second question is the more important one. By some tests I've killed a IC on the position B2. It has 14 pins and the name UHP407 on the frontside and PHIL 004 54 on the backside. The boardtype is REMEX ASSY 114861-001 REV. Nobody in Vienna knows the IC. Does somebody know if the IC is compatible to a known IC. If not where I can buy it or better the Address of the company.

Please send me your help directly to

From: S.Usher@ucl-cs.UUCP
Message-ID: <359@ucl-cs.UUCP>
Source record: 249002

From: Stephen Usher <S.Usher@uk.ac.ucl.cs>

I can see one or two major problems with TOS if you try to make it multi-task. The biggest problem is the file system. What happens when two tasks want to access the same file at the same time? What error message do you return? TOS cannot handle such things and there are no error returns which mean "in use". Working out which process gets access is difficult, it's fine if both the processes want to read (you give both shared access, again not possible with TOS), but what if one wants to write?

Another problem (though it should be under the same heading) is device access. This MUST be exclusive, after all you don't want two programs trying to write to the printer at once.

Fixing the above would also allow for true networking possibilities, after all, if you can have two processes accessing resources at the same time, why not two machines?

This brings me to my next point.

If the ST could multitask, then a true network system could be built VERY simply using a server task on each machine sitting on the network (it could use the MIDI port to start with). In this way there would not have to be ANY fileserver machine and ALL resources could be shared.

All of the above can be done on a Sinclair QL, even the networking! I know what I'm talking about, Multitasking is great, I REALLY miss it on the ST, so much so that I prefer the QL for doing assembler program developement for the ST!

>floppy disk _only_when_the_Alternate_key_is_pressed_ ? Doing that you could
>get rid of this real frustrating wait period if no disk is in the drive.

I have two (possibly useful) things to say about this.

1. The disk drive atkes less time if a warm reset is used.
2. If no attempt is made to access the disk drive, then the system
won't know that there is one available, and will disallow
acces to Dsik Drive A.

Check this if you want, but that is the expreince I have had with
TOS 1.0

Yours Andy.S

You must be thinking of the BMS-100 board which we are no longer shipping. The BMS-200 has replaced it and has a 1.6 Megabyte/second sustained data rate. One CDC Wren SCSI drive that a customer brought by had a transfer rate of about 700+ Kbytes/s. Both the Atari's host adapter used in the SH204 and ICD's host adapter transfer data at about the same rate.

986. GNU-Emacs wrapper for Gulam

Newsgroup: comp.sys.atari.st
Date: 1989-08-09 15:42:00 UTC
From: roeder@sbsvax.UUCP
Message-ID: <830@sbsvax.UUCP>
Source record: 249009

Some people have reported trouble when they use GNU-Emacs under the Gulam shell.
The reason why suspend-emacs does not work as expected is that i assumed that
the shell saves all registers it uses and restores their original values on
exit from the shell. But Gulam trashes them. Now GCC has put some subroutine
address in a register which is no longer valid. This must lead to a crash.

I have fixed this in my library which will soon be posted but apparently i can
not post again 16 Parts of GNU-Emacs just for this fix.

So the appended little program tries to fix the problem. It intercepts a system
call from Emacs going to Gulam and saves all registers before the actual call
and restores them when the call comes back.

Another problem with Gulam is that you cannot get an interactive shell by just
passing "-i" or "" to the shell (older Gulam versions allowed ""). Therefore
i am changing "-i" to "ue". You will get into the build-in micro-Emacs of
Gulam where you can do some work. To go back to GNU-Emacs you type ^Z or ^X^C.
If you type 'exit' then GNU-Emacs is terminated.

Just a few notes about other problems which people have reported:
- The \etc\termcap file must not contain CR after '\' at the end of a
line. Otherwise the entry is read incorrect by Emacs.
- The documentation files are not searched in $EMACSLOADPATH. This is
a problem from the original Emacs. If your shell has no symbolic
links you have to use the original directory structure.
- The functions suspend-emacs/call-process can ONLY work with shells
that use the _shell_p system variable. In other shells you get the
message "Program stopped!!!" but Emacs resumes instantly.
- Emacs cannot understand the use of drives in strings like
"A:\homedir" but it understands both "\dev\a\homedir" and "\homedir"
and of cource the same with slashes in place of the backslashes.
This applies to all environment vars read in by Emacs (eg. HOME).

On just another topic: if you recompile Emacs with the new malloc-routines from
Piet van Oostrum and Atze Dijkstra you will get less memory for system calls
(almost nothing) but even on a 1 MB system you could work some hours without
running out of memory. This is because i had to use the C-alloca in the posted
version.

- Edgar

>could almost sell me one.
>
>What inspires such loyalty?

Speaking only for myself, "I don't know, but whatever it was, it's gone".
(Warning: A very long diatribe follows.)

When Atari rolled out their original 8-bit line, I bought an 800. I was
quite happy with it, and still believe that in many ways it was the most
advanced peecee, software- and hardware-wise, of its time for under $2,000
(this includes the Apple II, Radio Shack stuff, Commodore Pets, Exidy
Sorcerer (anyone else remember this one?), and soon-to-be released and
much-overhyped IBM PC and Commodore 64).

Nevertheless, Atari owners could be recognized by their instinctive
bristle at the question, "Oh, you own a computer? What kind?" We were
somewhat plaintively to be heard saying things like, "Well, yah, it
doesn't have slots, but..." and "Well, it does play great games, but
it also..." Amiga owners that I know remind me very much of we owners
of Atari 8-bitters in that respect. (Though Amigans can now counter the
stupid "But does it have slots?" question, the defensive "But can yours
multitask?" seems to be a universally-used shot, and indicates a similar
deeply-rooted inferiority complex. :)

Of such stuff is the nature of fanatic loyalty made. You picked your
"lowly" Atari over the haut couture Apple and pin-striped behemoth PC
and "cheap imitator" C64 because you KNEW it was better technically.
It not only was, it HAD to be, because otherwise you really were duped
into buying the "not best" machine for the money, right? That little
rationalization is still just as valid with computers today, not to
mention cars, stereo equipment, or any expensive item.

So when Atari rolled out their ST line, the company had much good karma
in my books. I very much liked the Apple Macintosh after playing with
several, but (again), couldn't afford it. I saw an ST demo'd, was duly
impressed, and bought an ST. For less money than the 800 alone cost
($800 vs about $900), I had a half-Meg 68000 machine with disk drive and
superb monochrome monitor. By comparison with my 800, it was a vast

improvement in many ways. I believe that, like the 800 was in its time and price-range, the ST was the best buy. (To fend-off indignant Amigans, at the time I bought my ST, the Amiga was a rumor named the "Amiga Lorraine", I believe. Had I waited another 6 months I may have made a different purchase. Had I waited another year or two I certainly would've.)

So why aren't I inspired anymore? Part of it is what I hope is a bit of maturation on my part; the realization that, hey, practically any computer has something good to recommend it, and if it does the tasks you do, then be happy. There's better ways to expend energy than in silly flame-wars over "whose toy is better".

Much of it is also the perception that Atari unwrapped a really nice little box in the 520ST back in 1985, then... And then... And then... Well, there's the 1040ST; a repackaged 520 with twice the memory and less cables hanging out the back. There's the MEGA-2 and MEGA-4; a repackaged 1040ST with more memory and one Atari-specific slot.

But wait! Don't forget about the "under $1,000 laser printer!" Well, gee, guess it costs just a bit more. And it really doesn't work so well unless you have a 2Meg machine. And I can't really use it on anything but an ST. Hmmm.

But wait! Don't forget the video blitter chip! Hey, that'll make all your programs fly! Well, gee, guess it really won't do us 520ST owners any good. And it really doesn't seem to speed up most things very much at all. Hmmm.

Whoa nelly, but wait for the 68020-based "TT" machine! Now THAT will be slick! Well, it's 1986 now... Well, it's 1987 now... Oh, it's 1988 and now it'll be a 68030-based box, guess that's good news... Well, it's 1989 now... Hmmm.

Oops, forgot about the wonderfully sexy Transputer-based box, what they now call the "ATW", I guess. Hey, that's actually shipping! Oh, in Europe... To developers... For about what a NeXT or MAC IIx costs... Not much software for it yet either (not much for a NeXT either, but at least that's a sexier box :)... Hmmm.

But hey, at least there's lots of great software available! Even some of the original 8-bit "greats" are still around, like O.S.S. with their very nice PERSONAL PASCAL, and Batteries Included with their wonderful DEGAS Elite and Thunder! packages. Well, they were here just a minute ago... Hmmm.

Well, at least TOS 1.4 will have most of the OS bugs, well some of the bugs, well a few of the bugs fixed. Maybe I can spend my nickels on that... Hmmm.

Frankly, what there is about the Atari product these days that inspires "fanatic loyalty" is completely beyond me. The ST is still a decent little box, that runs a selection of nice/fun/useful software. But fanatic loyalty?? Nope.

The slogan "power without the price" is a sad & tattered white lie; cheap PC clones offer comparable bang for less buck, and a wider variety of software to boot (no pun intended). Very little of anything substantive has come out of Atari in the past 2-3 years, so one hasn't even the option, as I did in 1985, of buying something on the cutting edge of price / performance / techno-glitz / whatever with an Atari label on it. As if I desired to do so.

Based on past experience, about two years after I buy a peecee, someone will tell me that it is obsolete. Another 2-3 years after that, I will begin to get the itch to buy something better. A year later, I will. If all goes according to schedule, that means that I'll be buying something new next year or 1991. I seriously doubt that it will have an Atari label on it. I like the direction Apple is headed with the Mac IIcx, but (again) probably won't be able to afford it. I like much of what I see that the Amiga can do. '386-based DOS machines, with the addition of things like H.P.'s New Wave software, are getting more attractive by the year. Who knows? Not Atari, though -- I don't hate 'em, but I certainly no longer love 'em.

>multi(tasking|user) operation because it is definetely not reliable enough.
>You WILL have this problem with all multi tasking systems running on an
>unmodified ST.

"Although MINIX was first implemented on the IBM PC/XT/AT familiy, it was
written with portability in mind. We considered it a challenge to test
the portability, and used the Atari ST as the target machine for a
number of reasons. The ST is a popular machine with a good price/
performance ratio, and attracts a different class of users. The ST
uses the Motorola 68000 processor, as several other popular micros
do, so that a port to the ST could serve as the starting point for
ports to the Apple Macintosh and Commodore Amiga. LASTLY, THERE IS A
WIDESPREAD BELIEF THAT UNIX, AND THEREFORE MINIX, REQUIRES THE SUPPORT
OF A MEMORY MANAGEMENT UNIT (MMU). PROVING THE OPPOSITE HAS BEEN ONE
OF OUR DRIVING FORCES." (excerpt from Intro to Minix ST manual)

You emphasize that MINIX ST is not secure and claim this is due to the
lack of the MMU. I agree that MINIX ST is not secure but claim that
this is not due to the lack of an MMU but due to the fact that Mr.
Tanenbaum wanted to keep things simple. To support this note that
MINIX is not particularly secure on the IBMs either even though they
do have a (sort of) MMU.

As for the security of other attempts at multiprocessing (eg. MX2), I
have not tried any of them so I really can't comment on them.

Finally, I agree with you that the Atari ST hardware is not meant for
multitasking. My dissagrement is that I claim this makes multitasking
difficult and inefficient (compared to a machine that does support it
in hardware) BUT NOT IMPOSSIBLE.

Let me close with the conclusion which I have been trying to get accross:
1) MULTITASKING IS USEFUL, EVEN ON A SINGLE-USER MACHINE
2) MULTITASKING IS POSSIBLE WITHOUT A GREAT DEAL OF EXTRA HARDWARE
3) MINIX AND MX2 ARE EVIDENCE THAT ATARI USERS WANT MULTITASKING
4) HENCE ATARI CORP SHOULD GIVE US MULTITASKING *WITH*THE*HARDWARE*TO*
MAKE*IT*EFFICIENT.

Date: 1989-08-09 16:30:31 UTC
From: andyc@hplsla.HP.COM
Message-ID: <5440046@hplsla.HP.COM>
Source record: 249012

```
|
| Having tried to get OPUS and BSTAT to work with GDOS has left me
| with a few questions concerning GDOS font management. OPUS
| documentation pointed out that the ASSIGN file of TIMEWORKS
| DESKTOP PUBLISHER has screen fonts that are not listed in the
| printer fonts. I ckecked and yes this is true! Not only
| that but among all the screen and printer fonts listed only two
| matched up regarding font type and point size. What happens when
| the program tries to do a print with a screen font that has no
| matching printer font, or the case where there is a printer font
| but the wrong point size?
|

It is possible (and apparently common) to use a GDOS font both at it's defined
point size and at multiples of it's point size. For instance, a 7-point font
can be used to print a 14 point font. The results are never as good, the
letters of the doubled font are noticeably jagged or blocky, since the
resolution of the doubled font is halved. The reason for doing it is the
substantial task of creating yet another font size is eliminated. Easydraw
2.3 uses this trick for some fonts; I'm only guessing that this is what
Timeworks DTP is doing.

> floppy disk _only_when_the_Alternate_key_is_pressed_ ? Doing that you could
> get rid of this real frustrating wait period if no disk is in the drive.
>
The reason is that if the Hard disk goes bad in any way, you can get controll
through the floppy. A bootable floppy can be inserted any time there is
a real problem.

The ALT key handles most logical errors (like bad .prg in /auto and bad .acc
programs) but not all hardware errors. Such as if the Hard disk sector 0
reads into the wrong area, or forgets to stop reading.

Anyway, It is always best to give the user a choice, and boot floppy first
is the way to do that.

Well, we've sold eight of our memory boards so far; there are six left as of 9th August. I shall be away 14th to 18th, so there may be a little delay if orders arrive next week. If there's a vast demand and no complaints, we might go for a second run. Sorry chad@norge.dec.com, your notification bounced. Also, Ian Hawkins, yours is on its way, if you're on the net.

Thanks to everyone so far for the interest.

in article <89080709104987@masnet.uucp>, david.megginson@canremote.uucp (DAVID MEGGINSON) says:

> The advantage of multi-tasking is that every program would not have to
> try to emulate every other program (note the plethora of programs with
> file functions like copy and disk format built-into them), and that
> different sorts of programs would not have to compete with each other,
> but could come together into some kind of large, useful whole.

That is basically what AREXX on the Amiga does for non-trivial cases. Certainly a single-tasking wordprocessor can include a minimal database function, or allow small specially written programs (Desk Accessories) to be called up for other peripheral functions during an editing session.

But if a particular operation is needed often enough in the wordprocessor, it should be easily added to that word processor. You're not going to be able to convince the author of your favorite program, in most cases, to add in this feature that you use constantly unless it's likely to be needed by lots of users.

Now move this to a multitasking system like the Amiga. The wordprocessor has only wordprocessor functions in it, and one extra goodie, an AREXX port. If I find I need a database function from within my wordprocessor on a regular basis, I can write a simple AREXX macro that'll use the real, full fledged database program, via it's AREXX port, from within my wordprocessor. All pretty transparent once the macro is written, as one might expect.

Multitasking has been around for quite some time. It's really only now becoming extremely useful, rather than just handy, to users, thanks to user interfaces which make it far easier to manage separate tasks that UNIX-like job control, and thanks to inter-process communication mechanisms like AREXX, which let any program become a system resource that all other programs can take advantage of.

Message-ID: <8908092055.a019457@nabla.electrical-engineering.umist.ac.uk>
Source record: 249019

Another plea for information on the upgrading of a 1040 with surface mounted MMU. Is the surface mounted chip cabable of dealing with greater than one megabyte?. Has anyone out there succeeded in putting extra RAM in such a machine?. I'de like to know so that I can decide if it's worth attempting.

Thanks
Ian H.

997. Various topics

Newsgroup: comp.sys.atari.st
Date: 1989-08-09 21:18:04 UTC
From: emmo@moncam.co.uk
Message-ID: <267@marvin.moncam.co.uk>
Source record: 249020

First, an apology. Due to a misunderstanding between Harry & I, Harry recently posted that we might run a second batch of the 2/4 Mbyte expansion board. Regrettably, that's a no-go. The batch we had made were cheap as a returned favour from the PCB makers. Also, we do not wish to damage those companies who make their living from selling extras for the home computer market. Their presence is vital. As an aside, I DO think they should offer THEIR bare boards for the DIY people, who will otherwise resort to 'piggybacks' or prototyping boards. If anyone else can get a cheap batch run, and will undertake to sell at around cost price, the photography is still available. Remember, this board is for ZIGZAG drams.

<change hats..>

I've been following the multitasking debate with some interest. I disagree generally about the MMU being ESSENTIAL, Sinclair's QL (forget the grotty keyboard & microdrives) made an excellent job of it using nothing more than a 50Hz interrupt & a good OS. Sure, a rogue task can scribble all over everything, but even a MMU wont stop bad code from causing total system failures, only one particular type, and only for a limited number of tasks.
Incidentally, somebody (not me, I'm off for a week [sighs of relief]) should post a short article explaining to the less hardware-oriented types, what a memory management unit does, so's they can all join in (or at least understand what's being said).

<change hats>

The participants in the decoupling capacitor debate have both omitted to mention that the most critical parameter when dealing with fast changing signals is the INDUCTANCE of the connections between the IC's power pins and the decoupling device. I read the results of tests made with an American product (Q-CAPs ??) which were large thin capacitors designed to fit under the chips, connecting directly to the pins with NO inductive path between the capacitor and the pin. As a result, you could reduce the capacitor by a factor of 10 and still see an improvement. I forget who actually makes them, but RS sell them in the UK, one is their ref 126-269. The point is that they can also be retro-fitted ON TOP of the chip, if you have problems.

I was taught selection of the value of a damping resistor is a function of the impedance of the track and the rise time of the signal. John M Logajan is quite correct, DON'T change it unless you alter the track. Hitachi (as I recall) suggest that PCB track width and thickness be selected so that this will normally be within the range of 25 to 50 ohms, but I doubt if Atari chose 68R randomly. Piggybacking chips will not impact greatly on the track impedances, adding flying leads will.

Continuing the discussion prompted by jbww@ukc.ac.uk (J.B.W.Webber)

>(ever done a recursive directory listing on a network of Suns?), but,

Yes, and symbolic links make it even messier but I wouldn't want to do away with them...

Seems like what you need is a nonvolatile ramdisk - How about bubble memories, I haven't heard much about them for a while.
Looks like you may have to be patient. Still, it didn't take long to get from a 1K ROM, 1K RAM system to where we are today...

No more sounding off for a week, I promise!

Dave E.

>in the background; re-write the CAD program so that it'll re-draw in the
>background.

Sorry, but I can't buy it.

I don't consider myself a power user, but I typically write about 15,000 lines of C code per term for my course work. I have the enormous luxury of being surrounded by workstations (microvaxen, VaxStation (2000, 3100), Suns) which I use regularly. I use X Windows, and rarely have fewer than six windows open with various combinations of shells and interactive X applications (let's see ... I'm currently working with nine). I have on occasion put all of this equipment to marvelous use (eg. in the spring, while implementing a ray tracer for a graphics course, I often had several compiles, several test tracings, LaTeX running a couple of times preparing my last minute documentation, all running together while I swapped between a couple of VI sessions).

But you, sir, have me beat. My own humble brain just can't multitask as fast as your Amiga (or whatever). I can honestly say that I am completely incapable of concentrating on a spell check session (which will undoubtedly require my attention within seconds), a database session, a spreadsheet session and a CAD session.

In fact, since this discussion began, I have carefully monitored my usage of multitasking while using the multivarious UNIX boxes around here, and I can honestly say that, since Greg Csullog's original article first appeared, I HAVE NOT BENEFITTED FROM MULTITASKING. I am doing task SWITCHING like its going out of style, but I just can't keep up with more than a couple of things. When I go home at night and turn on my Atari, I squint at its tiny screen, gripe about its attached keyboard, whail and moan about its buggy OS, but I have never been using a word processor and suddenly wished I could format a disk, download a file

edit a spreadsheet, and play a game SIMULTANEOUSLY. I would kill for a good task switching mechanism (and enough memory to use it), but the kind of multitasking that is beyond the ability of a good task switcher (eg. Multi-Finder) would be a scarcely used luxury.

This is just my opinion. I don't doubt that there are people who really do benefit from multitasking. I even find it convenient once every other month. Perhaps I have not evolved sufficiently, and will grow to need multitasking as my brain develops. But please don't assume that the only people who think they don't need multitasking are those who haven't tried it.

>

there were many such problems in version 1.2 of Quick ST, so i won't bother justifying them here. as for version 1.46, there is a known bug in that version which affects the clipping of letters and lines, which causes the improperly drawn window contents when the text/lines have to be clipped. this bug crept in version 1.46 when darek and i tried to speed up our clipping algorithm, and these problems should be all but gone in the latest version we are currently developeing.

the new version will be put through a LOT of beta testing before its released to the public, to avoid such embarassing incidents as improperly clipped characters. we will try to have this version out sometime in early Sept. development work for Quick ST will become a little more difficult since, now that our school term is over, both of us are going back to our work term jobs, myself at Electrohome and Darek at Microsoft (in Seattle), which will make the synchronization of debugging effors a little more difficult, thus developemnt will slow down a bit.

but hey, keep dem bug reports coming in. the reports and support we have received thus far has been great, and i myself enjoy seeing just how far this venture can go.

anyways, enough for now.

I know this has flogged to death here, but I have two questions I would greatly appreciate answers to:
1. Does the Datafree memory upgrade board go to 1 Mbyte as well as 2.5/4 on an older 520ST?
2. Does anyone know if a TEAC FD-235f-100-U floppy drive will work with an ST? I would be using it to replace an existing Chinon F353AT single sided external drive. I'm prepared to modify the face plate if buttons/LED's don't match.
Please reply via email:
usermeso@mtsg.ubc.ca or usermeso@ubcmtsg.bitnet
Thanks alot!!

1002. Re: Loyal Atarians?!?

You bet that I will not be buying an Atari machine next time around! Where is smalltalk for the Atari? Does my Lisp have nice 'engines' like PC SCHEME? Can I have multi-font word processors like I have in the Mac? *N*O*P*

To be fair, there is MWC, a very decent compiler and WordPerfect (who is not likely to do any more work for the ST), but compare my spreadsheets to Excel!

In the balance, I was (still am) poor and could not afford any better. Now I am saving to be able to overcome computer poverty. Atari sure has let down the north american customer, so I wish them well when they move their head-quarters to Germany.

No, I can not be loyal to Atari.

Andres F. Moreno

p.s. I do hack my machine all the time, and for that, it has served me ad-mirably.

1004. DeskJet Plus weirdness

Newsgroup: comp.sys.atari.st
Date: 1989-08-10 03:36:52 UTC
From: logajan@ns.network.com
Message-ID: <1546@ns.network.com>
Source record: 249027

Well, I just got my DeskJet Plus printer, and it didn't work (at first.)

It turns out that I have to power up the DeskJet before I power up my Atari 520 ST, or the handshaking between the two comes up hung.

If I thereafter power down/up the DeskJet, I've lost the printer until I push the reset button on the Atari.

Anybody else have this problem, I don't recall it being mentioned.

(Of course I didn't recall that the regular DeskJet Epson emulation cartridge wouldn't work on the DeskJEt Plus, either. I specifically asked the ComputerLand salesman and he told me (and sold me) that it would indeed work. Well it didn't so they'll have to order a "Plus" version of the emulator and exchange it with the one (wrong) that they had in stock.)

While MINIX, MX2 and RTX make brave attempts at providing multitasking on the ST.... its not often that i risk losing something or bunging something up.. as happens when the OS so often croaks... still, paeans to the programmers for their determination. Just imagine what these guys could produce if Atari gave them the hardware they need!

Yes... i could definitely use multitasking on a daily basis. WHile my music sequences were running in the background for teaching.. i could be dealing with accounts, addresses, billing and so on....writing up practice outlines in a WP...

How 'bout it, Atari!

>You WILL have this problem with all multi tasking systems running on an
>unmodified ST.

Yup. You will also have the _exact_same_ security problem with any task switcher on an unmodified ST. At the very least the taskswitcher must keep part of itself in memory. I can trash that from my program. You will have the same problem with a RAM-disk.

This is not an argument against multitasking and for task switching because it applies with equal force to both.

|>even if you want to - basta.
[]
|
|Amen to that! Amiga owners have suffered with the lack of an MMU. The
|usefulness multitasking is a given, IMO. The security of Amiga's multitasking
|is poor due to the lack of memory protection supplied by an MMU. Those of
|you who agree multitasking is useful, and would like to see it on an Atari:
|Demand it from Atari and demand MMU support as well.

I think two issues are being confused here, the need for per process memory protection, and the possible to run processes 'simultaneously'. Why should memory protection be a hotter item when parallel processes are involved? In the current situation it is just as well feasible for instance by an application program to thrash the space of the shell it was invoked by. So if you insist on security, you should insist on it right now already.

An MMU alone probably won't hack it; you will probably want a 680x0 (x >= 1) to be able to page in new memory (a 68000 doesn't maintain enough internal information to be able to restore correctly from a BUSERR).

In article <1989Aug4.173233.8259@sj.ate.slb.com> greg@sj.ate.slb.com (Greg Wageman) writes:
[]
|Typically, a task cannot be suspended in a multitasking environment
|until one of two things happens: it makes an operating system call
|which must wait for an external event (such as an "operation
|completed" interrupt) and is then put into a "blocked" state by the
|OS; or, in time-sliced OS's, its time quantum expires. Some real-time
|multitasking kernels do not require time slicing, so blocking calls are
|the only way a task switch ever occurs.

Read for this moment for 'an operating system call' a GEMDOS call, for 'time quantum' a (number of) VBL interrupts (or other clock generated interrupts).

|
|The implication is that if the so-called "background" process is doing
|something CPU intensive(e.g. an in-memory sort), it may not make a
|blocking call for a very long time (i.e. several seconds). The user
|will begin to type characters, generating an interrupt which will
|unblock his foreground task. The OS will move the now-unblocked
|foreground task to the "ready" task queue, but it *will not begin to
|run* until the background task blocks (or its time quantum expires).
|If the system clock is grainy enough (i. e. the clock "tick" interval
|is very large), or a task context-switch is very expensive, or (yuck!)
|both, hundreds of milliseconds will elapse between the user's keypress
|and the resumption of execution of the foreground task. Thus, the
|user will perceive a very sluggish response from the foreground task.
|
|The reference to a machine designed from the start for multitasking is
|valid, because proper hardware design can minimize the expense of
|context-switching, provide a suitably fine-grained system clock, and
|include appropriate interrupt support for devices. Trying to
|retro-fit multitasking into a machine not designed for it is at best a
|frustrating job whose results may not justify the effort.

The discussion about multitasking triggered my interest, so I decided to try some things out. It appears that context switching is easy if you do it at the moment of a GEMDOS call: all registers have been saved on either the stack or the basepage, so in fact all you have to do is check whether perhaps another process should continue (note the very small overhead). To be able to have more than one process running (detach a job), I made a small change to Pexec() so that a new process can be started, but the parent process is not waiting for the child to finish. If a process does a call that may involve some time, like

reading a character from the keyboard (Cconin(), Cnecin()), this process only continues its call when there is a character available, so it will not unnecessarily block other processes.

Implementing this scheme took only about a rainy afternoon, so you can't say the effort was that great. What I would like to add is a time-slice mechanism for CPU bound processes (no GEMDOS calls for a long time), based for instance on the VBL-interrupt. This is also easy: if the CPU was in user mode when the interrupt occured (no pending GEMDOS/(X)BIOS/GEM calls) and the current process has had its slice, save registers a la GEMDOS and run another process. The blocked reason that is kept with each process will tell the dispatcher how the interrupted process must resume when it is ready to.

This program I'll make available through comp.[binaries,sources].atari.st within a reasonable amount of time (still to do some speed improvement, the time-slice handling, make it ROM independent and probably the replacement of C by assembler). Right now it is still wonderfully small, about 2 or 3 K.

Leo.

From: jensen@cod.NOSC.MIL
Message-ID: <1605@cod.NOSC.MIL>
Source record: 249037

I have the version of PageStream that was released toward the end of 1988, the first really "usable" version. (I don't have the disk with me at the moment, so I can't give the numerical version number.) I use it occasionally, but the more I do the more frustrated I become with the bugs.

Can someone tell me the number of the latest version? I haven't received any word from SoftLogik about availability, but I recently saw a message on the network that made me think there may be a newer one.

I've been giving SoftLogik the benefit of the doubt since the days of the original Publishing Partner, but it's beginning to wear thin. If there has been an upgrade sometime in the last six months or so, what are the terms?

Thanks for any help.

In article 368 Roger Critchlow writes,
>>
>> The Julian day number is the number of days since 4004 BC or when ever it was
>> that someone calculated that God created the earth.
>
>The Julian day number counts from Greenwich Mean Noon, January 1, 4713 BC.
>Given the Julian day number (JD) the formula ((JD + 1.5) remainder 7) gives
>the day of the week counting Sunday as 0. So Julian day number 0 was a
>Monday. Hmmm.

All will now be revealed!

In 1583 a French scholar Joseph Scalinger devised a calender system which
counts the days in order to match up the chronology of historical events of
different civilisations. Scalinger desired to make day 1 in his system have
some calendrical signifigance and therefore chose day 1 to be

1) Sunday January 1st (once every 7 years)
2) a leap year (once every 4 years)
3) a new moon (once every 19 years = 235 lunar months)
4) a Roman indication (census) (once every 15 years)

As all these numbers are mutually prime this means this "Julian-cycle" is
7x4x19x15=7980 years long. The last such date, Scalinger calculated was
January 1 4713 B.C. (note 4713 B.C. is a leap year though not divisible by 4
as there is no year 0 between 1 B.C. and 1 A.D.). This date suited
his purposes as recorded history came after this date.

In 1582, Pope Gregory XIII recognised the year is not 365.25 days long but
365.2422 days and decreed that ten days which had been accumulated over a
thousand years be dropped thus the day after 4 October 1582 was
15 October 1582. This "Gregorian" calender took a while to be recognised
in Protestant countries but it was eventually universally accepted. Thus
Scalinger's day 1 no longer has its significance in our modern calender
system, but this doesn't matter once it is chosen - one simply counts the
days without regard to calender rules.

P.S. in 1650, the Archbishop James Ussher of the Anglical Church calculated
the creation of the earth took place at 8pm on October 22, 4004 B.C. which
is where the other date came from. He didn't specify if this was G.M.T. but
maybe he assumed a flat earth.

1016. 520 1-meg upgrade

Newsgroup: comp.sys.atari.st
Date: 1989-08-10 15:14:00 UTC
From: WELTE@BUPHYC.BU.EDU
Message-ID: <8908101516.AA03033@bu-it.BU.EDU>
Source record: 249039

I have a question concerning the two recently posted 1-meg upgrades for the 520 ST. How is the memory controller chip (U15 on the board) numbered? In the second of the two postings, the numbering was given as counterclockwise while looking at the bottom of the board. There are numbers on the TOP of the board (component side) which run counterclockwise.

The problem I'm having is that when I follow the "bottom" convention (counter-clockwise while looking at the noncomponent side), then I can't get it to boot. If I use the numberings on the board (counterclockwise from component side), then the computer boots, but I still have only 512K. Hmm..... I am happy that the computer didn't smoke (yet!), but I think that the only thing wrong is where the busses are connected from pins 4 and 15 (x2) from the new chips. I checked everything else long before I put 'er back together.

Thanks for your help....

> people supporting the ST out there. I would like to thank DC Software
> ---
> Kevin B. Clendenien kclenden@silver.bacs.indiana.edu
> ---

Kevin said in his reply that I was 'whining' about a small defiency in DC PORT. But, my main point was that DC SOFTWARE was being penny wise but pound foolish by leaving out the hardware RTS/CTS. I don't know which UART they used but I am sure that adding RTS/CTS is mainly just a case of adding another RS-232 line driver and line receiver set of ICs. So, to save a couple pennies in their design DC SOFTWARE has eliminated abig market. There are a lot of USR 9600 modem users out there just begging for a working hardware RTS/CTS with working software drivers.

So, if this is whining, so be it. I am simply pointing out to DC SOFTWARE, and anyone else out contemplating such a product, to test your market before finishing your design. Ask your potential customers for their desired features, and be willing to change once they see your product.

The 'whining' thing brings up another complaint of mine. Why is it that ST owners should be satisfied with a less then perfect product, or with a product with known defiencies, just because a company was willing to market it to us in the first place? I mean, don't we desire the right to be critical of ST products, or should we simply bless any software or hardware product that a company is willing to market, just because they were nice enough to market it?? Awwggg!!

Richard (the 'whiner') Covert

Unfortunately this is a hoax. There is no C.E.K.A Enterprises.
James McHugh is someone who decided it was time for his 15 mintues of
fame.

James McHugh showed up on GEnie a few months ago and announced
that he was going to be releasing a clone of the Macintosh OS ROMs and
that his hardware/software would let Atari STs, Amigas, Apollo and Suns
(I'm probably forgeting some, he listed almost every machine that uses
a 68000 family CPU) all run Macintosh software. He promissed to send
lots of people prototypes, and agreed to show up and do several demos.
I've heard that several magazines even published his comments and lauded
him for his programming skill (they did this without even seeing a
prototype, which shows how real things in magazines are).

Then people who know how the Macintosh works started asking him
questions and he was unable to answer them correctly. He had no idea
how the Mac works and what is needed to make non-Apple hardware work
like a Mac. Soon after the questions started he disappeared, his
phone, the one given above, was disconnected. No one has heard from
him in a couple of months.

If you like conspiracies you can believe that big evil Apple
did away with him. Maybe they moved him in with Jimmy Hoffa. It's
much more likely that he was a kid who wanted to be famous and get lots
of attention, and now he's gone back to his normal, boring, life.

If people are interested in running Macintosh software on the
ST, or other computers, contact one of the real companies (eg. Gadgets
by Small or ReadySoft). Don't waste your time on James McHugh.

Seriously ? Interesting. I find my most frequently used instance
of 'user level' multitasking is reading news while a compile is taking
place, or when I'm doing a raytrace.

(the second instance is opening another shell to get a directory
of a disk I'm about to write all over :-))

On a lower level, there's lots more going on; UUPC, NFS,
I don't notice those unless I need them though)

1020. Terminal program with smart buffer wanted

Newsgroup: comp.sys.atari.st
Date: 1989-08-10 16:42:06 UTC
From: jsd@gaffa.mit.edu
Message-ID: <12402@eddie.MIT.EDU>
Source record: 249043

There are several programs for the Macintosh which can buffer the input from the modem while letting you scroll back through already received material. So, I could be printing out a 20 page manual from the host, and reading it at my own pace, scrolling through it. while I am doing this, the new stuff is still being received, and placed in the buffer properly. The version of Uniterm I have (2.0d) is close - it will record stuff, but you can only see stuff that has already come in, ie: if new stuff comes in while you're in "View History Buffer" mode, it won't show up until you exit that mode and re-enter. If anyone can point me to any package, be it commercial, shareware or whatever, I'd be eternally grateful.

1021. PC Board Designer/Atari ST Software Bargain

Newsgroup: comp.sys.atari.st
Date: 1989-08-10 17:02:55 UTC
From: charlie@oblio.UUCP
Message-ID: <508@oblio.UUCP>
Source record: 249044

There is a local store here in San Jose, called San Jose Computer, which is selling the Abacus/Data Becker PC Board Designer software package for $50.00 new. The package lists for $249.95 or something like that.

Seems like they bought about 200 packages and need to blow them out.

If you are a hardware hacker/hobbyist and designing boards of nontrivial complexity, this package is a hell of a deal for this price.

I bought one and have been playing with it for a couple of days. Very nice; includes an auto-router. It prints out 2 to 1 enlarged component/trace layouts on an Epson FX (MX), 24 pin printers, and HPGL plotters ; will do boards of up to about 6.5" by 4.5". Component library capability will handle components of up to 120 connection points. Single and double sided boards are supported.

I like it.

The phone number for San Jose Computer is (408) 224-8575. I have no association with the store except for customer.

I should have mentioned this as well; the linker has to know
you have external code that will come from separate files (or
ROM or ?). With MWC there is a -k name option to ld for this.
Again, I haven't tried any of this.

(with free advice you get what you paid for :*)

1023. xscheme on terminator

Newsgroup: comp.sys.atari.st
Date: 1989-08-10 17:30:26 UTC
From: drc@beach.cis.ufl.edu
Message-ID: <20727@uflorida.cis.ufl.EDU>
Source record: 249046

The terminator archive (terminator.cc.umich.edu) has available
the C source for Xscheme, but no executable version. I, alas,
have no C compiler (and little interest in C) but would very much
like to run Scheme on my ST. Does anyone know where I can find
an executable version available by anonymous ftp? Is anyone out
there willing to compile Xscheme and post it to comp.binaries.atari.st ?
I would be very grateful for any help with this.

By the way, I know that an executable version of Xlisp is on
terminator; it is Xscheme I want.

I forget the details on this but my understanding is that in most cases (ie:
most programs that create/modify files) the archive bit is handled correctly.
The problem with depending on the archive bit is that there are a few programs
that modify existing files in such a way that the archive bit is not changed.

1025. Megafile 60 speed

Newsgroup: comp.sys.atari.st
Date: 1989-08-10 19:01:05 UTC
From: swklassen@dahlia.waterloo.edu
Message-ID: <15821@watdragon.waterloo.edu>
Source record: 249048

A couple weeks ago I went out and purchased an Atari Megafile 60 hard drive. I was a little dissappointed when I read the specs and discovered that the average seek time was only 61ms. At that point I decided to put up with the slow drive and purchase it anyway.

Just today I decided to run ratehd on it in order to find out how slow it really was. This program told me the drive had an average seek time of 30ms. I didn't believe this so I repeated the program a few times with the same result. Needless to say, I was pleased!

I am left with two questions, one for the authors of ratehd and one for Atari.

1) Is this program at all accurate or should I not be comparing the 30ms result it gave me to the 61ms result in the hard drive docs?

2) Why is there this LARGE discrepancy between the docs and the drive? The model of this drive is SEA 5 065. Is the drive I have some newer version?

> [...]

I'm not sure but doesn't the archive bit indicate 'Dear backup program, I'm a file you should add to your archive because I was changed/created after the last backup' ? So, if backed up, a file's archive bit schould be clear -not set.
My TOS 1.4 release DOES raise the archive bit on every file creation.
One of my ATARI ST Programming Guides says that the archive bit will be set on every successful file creation/write access.

Yeah, that was my first home machine, bought it in the spring of '79. I had played around with PET and TRaSh-80s, but I wasn't happy with the small displays, slow cassettes, and non-graphics of either of them. Of course, you could easily spend over $2,000 on an Exidy if you bought floppies and CP/M for it, but I never got that far. It was stolen in '84...

1029. Flash problems

Newsgroup: comp.sys.atari.st
Date: 1989-08-10 22:02:44 UTC
From: viljanen@cs.Helsinki.FI
Message-ID: <2048@hydra.Helsinki.FI>
Source record: 248802

I have a problem with Flash 1.6 and scandinavian characters.
You see, they don't work well together.

I have 100% english Mega-ROMs and I use the output of Simon Poole's
KEYEDIT.PRG to convert the keyboard layout to my liking. That includes
the scandinavian characters being on their proper places and not looking
like brackets and a bar.

Now when I use Flash and it's Atari mode and fiddle with translation
table, all is fine and the keyboard and the screen output is just as
I want it. But it all changes when I move to ANSI-mode... No scandinavian
characters at all with translation table!

But If I turn the trans. table off, it starts working...sort of.
When I type, the characters are what they should be, but when I receive
stuff, the scand characters are brackets and a bar ({ and } and |),
not real scandinavian characters (a with 2 dots over it, a with circle
over it, o with 2 dots over it) anymore!

This would be simple to fix with translation table, but it's useless
in ANSI-mode! Can anybody explain why? Someone from Antic out there?

P.S Uniterm behaves very nicely under these same conditions... 8-)

From: PSYLONE@UOGUELPH.BITNET
Message-ID: <8908102232.AA21476@ucbvax.Berkeley.EDU>
Source record: 248803

I have the Beckemeyer MT C-Shell. Unfortunately, I cannot convince the Mark Williams C CSD (C Source Debugger) to work with it. Since the primary usefulness of the C-shell environment is helping development productivity, this is a fairly serious handicap.

Has anyone been able to convince CSD to work under the Multi-tasking C-shell? I've tried the entire gamut of trap vectors with no success to date.

On an unrelated note, does anyone have a "best suggested" path for funnelling mail between BITNET (or ARPANET) and the UUCP network? I have David Beckemeyer's UUCP address but all the mail I've sent via Penn State has "disappeared".

Thanks,

Brian

1031. Apathy and Defeatism

Newsgroup: comp.sys.atari.st
Date: 1989-08-10 23:23:26 UTC
From: Xorg@cup.portal.com
Message-ID: <21183@cup.portal.com>
Source record: 248804

Commentary:

There is a theory in political science and historical circles
that states that one of the main reasons why Central and South
American society is so fragmented and vulnerable to military coups
and drug cartels is because of an underlying feeling of defeatism
in the society itself.
This defeatism started with the conquest of the great Mayan,
Inca, and Aztec empires at the hands of a handful of Spanish
conquerors. These were centuries old cultures that disappeared
almost overnight. The native people of the time believed that
somehow they had failed their gods with the result being the
destruction of their worlds and their enslavement at the hands of
the conquistadors.
From that time on, Latin society was heavily influenced if not
completely dominated by foreign powers. Latin American history from
Cortes to 1989 is almost completely intertwined with European and
American history to the point that Latin American almost has no
history to call its own. Behind almost every major event or era
in Latin American history is a foreign influence calling the shots or
offering threats and/or aid.
The effect of these centuries of domination is a complete
breakdown of society. Latin Americans see no need to work for change
because they feel that they are not in control of their own destinies.
A strong defeatist attitude has taken over Latin America and often
this manifests itself into open hostility and attacks against foreign
influences of any kind - usually American influences.
A group of Latin American intellectuals has studied and observed
this phenomiium of Latin society in great detail - among them the
author Carlos Wrangel. They point out that until and unless Latin
America stops blaming its problems and failures
on outside powers
and finally comes to grips with its own internal
deficiencies as a
culture and society, it will be forever doomed to the a cycle of
internal unrest, military take-over, and social revolution.

>> Uh...Pete, this history lesson is great, but isn't this
>> a magazine about the ST??

Wait! The morale of the story is on the way! Just keep
reading, but keep everything you've just read in mind...

Welcome back to 1989 and the Atari ST community. Community?
Yep, just like an other organization of people, ST users form a community in the United States. Because the ST is not exactly a household word here in the States (yet :-]), we come together and meet in user group meetings or on-line.

As with any other community we have our leaders and our followers, our producers and consumers, and our 'good apples' and our 'bad apples'. Our society is also unique in that relatively few of us get to see each other face to face - almost all communication is done solely through on-line conferencing, e-mail, or phone conversation.
In the past few weeks I've noticed a problem with our community. Our problem is deeply entrenched and it threatens to eventually destroy our community and in the very least, severely damage it.
The problem is defeatism.
This problem is not one that is a stranger to me. My favorite hobby is board wargaming. Wargamers also form a very unique community since our hobby requires a lot of time, dedication, and personal study. If I had to take a guess I would say that there are perhaps 50,000-75,000 wargamers in the United States, not a large community at all. Yet even though one of the most prolific publisher of wargamers (SPI) went bankrupt in 1981, a few die-hard wargamers managed to keep the hobby alive. I'm happy to report that in the past few years I've witnessed a lot of new blood [pun intended] coming into the hobby and the mass return of old veterans coming back into the fold.
How did we keep the hobby alive? For one we refused to buckle under to the assault our hobby was taking from a strong outside influence -> Advanced Dungeons and Dragons and role-playing games.

[Did you catch the reference to 'outside influence?']
Wargamers banded together and kept in touch through newsletters and computer e-mail and recently a wave of wargaming clubs have appeared across the United States.
When someone asked about the stack of wargames piled into our closets we took the time to calmly and slowly explain to them what what we did and why. When someone expressed an interest in the hobby we slowly introduced them to a beginner's game and were very careful not to scare them away with over-bearing terminology. And most importantly - when someone bad-mouthed the hobby or thought it was all a waste of time we carefully but sternly defended what we were doing. Accusations that it was a 'dead' hobby fell on deaf ears, we stuck to our guns and kept doing what we enjoyed doing.

>> Pete please! Now your going off into a history of wargaimg!

Ok, sorry about that! Keep reading...

Defeatism is an ugly word. It is devoid of any hope or success. It closes the door on progress and change. And it terms of a society, it leaves a community wide open to outside influences.
In the past few months Atari has waved some pretty big carrots in front of our faces in the form of STacy, the TT, the PC4, the

Portfolio. But none of these great machines had yet to grace a single store shelf.
The ST community is also under attack from all quarters of the computing establishment. The most obvious and damaging being from an established and widely know figure in the computing community, Mr Gilman Louie, CEO of Spectrum Holobyte.
Even though Mr. Louie has probably never attended a ST user group meeting, even though Mr Louie hasn't frequented any of the on-line services, and even though Mr Louie probably doesn't subscribe to any St publications, he saw fit to make the claim that "...piracy seems better accepted by ST users" in an 'open letter' which he circulated not only in the ST community, but the entire computing community. The result is obvious, computer users everywhere pointed fingers at use and said 'see? I told you so!' Developers who were unsure about releasing ST software because they didn't know enough about the machine or the ST community were now made aware that the ST was a 'pirate's machine' by one of their own. Recent articles on computing in both "Chess Life" and "The Wargamer" had disturbing references about the 'demise' of the Atari ST line.
But this is not about the attacks on our community, its about defeatism, defeatism in the ST community. After Mr Louie's letter was circulated there was almost NO reaction from ST users, not a word was said by anybody.
Even more incredulous was that most every
ST publisher saw fit to print the letter without questioning the comments about our community!

Do the editors of our ST magazines really believe that ST users tolerate piracy? Do the leaders of our ST community really believe that ST users tolerate piracy more than MS-DOS or MAC users? Do YOU really believe that YOU tolerate piracy more than your fellow Amiga user? Then why was there no outcry? There can only be one answer - defeatism.
We let Spectrum Holobyte make us feel bad for 'accepting' the piracy of their game Falcon ST while it soared to the top of the sales charts. We let Spectrum Holobyte make us believe that they were losing money hand over fist as their price for supporting the ST market, in the meantime they were readying scenario disks for us. If Falcon ST was a money-loser then why would they bother to make scenario disks?
We rolled over like so many sheep and said "Thank you Mr Louie! We know we're the bad boys of the computer world, thank you for giving us this heavily protected game and its code-wheel! Thank you, thank you!" Patethic!
And this is not the only case. Visit to any rumor/chat section of any on-line service and you'll find it flooded with messages knocking Atari Corp. You'll find the bases flooded with people who use the ST as one of their 'other' machines lauding all the great new programs for their clones while bad-mouthing the ST. You'll find developers who seem to take extreme joy pointing out to

us that they make much more money in the MS-DOS world. They blame us for not buying the same numbers of programs even though as a percentage, ST owners are far more likely to buy a new piece of software than the average MS-DOS or MAC owner.
And we sit there and take it, never asking what these people have done to promote the ST, never asking these people if they have anything better to do than to make ST owners feel like the black sheep of the computer world, never asking them if they've written any letters to computer and general interest magazines to defend the ST.
Worse still, we watch all this, we see Computer Shopper feature an article on low-budget DTP systems without even once mentioning the ST DTP (while an Apple II is highlighted no less!) and we sit there and do nothing. The following should sound familiar:

Unless and until we are willing to stop kicking ourselves for buying the most powerful computer on the market, unless and until we act * as a community * to respond to attacks on our community from outside organizations and infulences, unless and until we work to let others in the computer know that the ST is a serious machine with serious user, we are doomed to accept the fate handed down to us - the ST WILL become a 'demised' computer.

Regards and Thanx,
Peter Szymonik

>

I would have to say that a drive's transfer rate make more of a difference
than the average access time. Unless you are doing intensive database work
which requires a lot of seeks or you have a badly fragged hard disk, the
transfer rate will make more of a difference. Compare a ST506/412's
5Mbit/sec to something like an Imprimis 94181-702M's 15-24Mbit/sec (ain't
sure on this one but it's somewhere in that neighborhood). The Imprimis
will just blow your socks off.

>

I have not used the SyQuest 10MB cartridge drives but I have used the 44MB
cartridge drives and find them to be quite reliable. Sure, you wouldn't
want to risk a cartridge by dropping it two feet but then again, would you
do the same to your fixed hard disk? The SyQuest 44MB drives are
auto-parking so power failures have little effect. They also work well on
their sides. Look at PLI's 44MB drive. They are suppose to work on their
sides!

From: logic@wet.UUCP
Message-ID: <400@wet.UUCP>
Source record: 248806

Have plans to purchase an USR HST Dual Standard. Question is whether the ST is up to it. Does anyone know if the software flow control that I've seen floating around works or not?

Also, why is this newsgroup comp.sys.atari.st and not comp.sys.st? Look at the other newsgroups, it's not comp.sys.apple.mac or comp.sys.commodore.amiga so why comp.sys.atari.st?

As long as I'm rambling, why was it so obvious that Amiga owners would just right into the multitasking debate? The first time I saw the original message, I said to myself, "Boy, those Amiga folks are going to jump head-first into this argument." And I was right, eh?

I now have three versions of satellite trackers on hand.

1.) My GFA Basic (for the ATARI ST) source listing.

2.) My compiled version (for the ATARI ST.)

3.) A "C" language satellite tracker program (not mine.)

#1 Was posted to comp.sources.atari.st
#2 Will be posted to comp.binaries.atari.st
#3 Not posted (but available on T. Kelso's BBS as the Seesat program.)

All three programs are also available from me for the asking.

>it?? Awwggg!!
>
>Richard (the 'whiner') Covert

Richard, I thought your request was reasonable. What I considered
unreasonable was your response to DC Software's response to your request.
You asked for something, and they said that they would provide it for
you, but you said, "Not good enough! I want it to have been designed
that way from the beginning." I do not think that DC Software has
ignored a large portion of the RS-232 market, as you claim. I have
no idea how much it would have cost them to have designed their board
your way from the beginning, but they chose not to because (in part,
at least) they felt that their current design would cover the majority of
the market. As far as accepting imperfect products, I don't think
that is applicable in this case. DC Software Multiport Board does
exaclty what it was designed to do, and it does it perfectly.

Simply take an assembler and write some garbage code that *accidently*
zeroes some important memory. The results will be hardly predictable.
Even if the system won't crash, some other users (programs) would be affected.
Needless to say that such an OS is useless to do every-day operation, as I
said before.

>Yup. You will also have the _exact_same_ security problem with any task

>applies with equal force to both.

I never said any word against this point of view. As I posted before, every
multi{PROGRAM|tasking|user} environment WILL have problems with inconsistent
coding which could happen every minute during software development. But this
problem would be ZERO if ATARI had spent some $$$ for a pMMU.

>a real problem.

Sure. But if you have your TOS bootstrap on ROM (as all ATARIans have, I
think), I don't see any problems with that. If the HD goes bad, you could
reset your machine & press the ALT key. Only then the machine should boot
the floppy first IGNORING the HD if it's mad. For this, TOS should ask for
reading from an existent HD if it was booted from floppy first. No problem.
So you could get rid of waiting for your floppy without losing control
over your booting machine.

1039. Re: ST and Multitasking

Newsgroup: comp.sys.atari.st
Date: 1989-08-11 11:35:01 UTC
From: leo@philmds.UUCP
Message-ID: <1068@philmds.UUCP>
Source record: 248810

In article <359@ucl-cs.UUCP> S.Usher@ucl-cs.UUCP writes:
|From: Stephen Usher <S.Usher@uk.ac.ucl.cs>
|
|
|I can see one or two major problems with TOS if you try to make it
|multi-task. The biggest problem is the file system. What happens when two
|tasks want to access the same file at the same time? What error message do
|you return? TOS cannot handle such things and there are no error returns
|which mean "in use". Working out which process gets access is difficult,
|it's fine if both the processes want to read (you give both shared access,
|again not possible with TOS), but what if one wants to write?

This problem is already there with the current (not multi-tasking) TOS.
Write a 'more'-like utility for the ST and you'll find out:
The more program opens the file for read. Now if you type 'v', you Pexec()
a vi program which will write out a file on exit. If you now exit more:
Surprise! two files with the same name :-(.

The remark about shared (read) access not being possible with TOS I'll
not take seriously, 'cause that just isn't true (the more/vi
combination is just an example of this. Generally, a Pexec'ed child
also inherits its parent's open files).

|
|Another problem (though it should be under the same heading) is device
|access. This MUST be exclusive, after all you don't want two programs trying
|to write to the printer at once.

The question is, whether you want exclusive device access. For
instance, in Unix, when you leave the printer device writable for
everyone (e.g. in a small system), two programs can write to the
printer at once (or to the terminal, for that matter). No, device
access must not always be exclusive, though in the cases when it must
be it would require some work for instance to make printer access
exclusive in the current TOS (e.g. like in Unix by a lpd daemon).

[]
|If the ST could multitask, then a true network system could be built VERY
|simply using a server task on each machine sitting on the network (it could
|use the MIDI port to start with). In this way there would not have to be ANY
|fileserver machine and ALL resources could be shared.
|
|All of the above can be done on a Sinclair QL, even the networking! I know
|what I'm talking about, Multitasking is great, I REALLY miss it on the ST,
|so much so that I prefer the QL for doing assembler program developement for
|the ST!

But now the question arises: what do you use your ST for?

Leo.

The latest released version is 1.52, which was a minor fix to 1.51.

Version 1.6 is due out very soon. A beta tester I talked to said "everything works ... even the spelling checker". SoftLogik was waiting for their TOS 1.4 roms to make sure the program worked with them.

They;ve also mentioned that they won't announce it's ready till it ships ... to prevent the previous ill-will when they missed release dates.

In response to an interesting story comparing Atari to Latin America....

Your points on piracy are well taken, and in fact very valid. However, there is NO way I am going to stop badmouthing Atari until I see them release and support something, period....

It really isn't difficult to do. Unless of course they are taking the dyslexia approach to the computer market: Build a great machine, and then give it zero support rather than build a mediocre box, and then advertise it to death...

I bought my ST within 3 months of its initial release. I love it. I developed and released the program Genesis through Antic Software, and am currently preparing a second program for release. I still believe in the ST, but I am now aiming somewhat for the European Market as the American market is limited du to the small number of dealers out there. I realize that the program WILL be pirated to death. This does not mean I won't make alot of money, but to you people that do pirate it, you're scum, and there will be some interesting twists built into it JUST for you. Nothing illegal mind you, but I certainly hope to make you pound your machine a few times in frustration...

The point of that last paragraph is that I still support the ST, but Atari appears to be the Rainman of the computer industry, and if they don't get their act together with the TT, they will perish, and justifiably so...

I have never cared much for what people think of me, so I have generally stated with reasonable pride that I own an ST, and when people snicker, I laugh in their faces, very loudly generally. The ST market is far from dead, you just have to be cagey about what and where you buy. However, a bozo is a bozo is a bozo, and most of them own IBM's and Apple IIgs's because of their names, the same reason that one purchases a BMW over an Acura or Nissan. These people won't change, so why worry about them ?

Hello everyone,

Could someone forward details about two items which seem to be
common knowledge, but which has not floated in this direction yet.
ST Report noted some dissatisfaction with Atari's Chinon swap-out
policy. Duh.... I never knew that such a policy existed. I
have a Chinon in my Mega2 and have always had 'funny' problems with
it, sometimes often, sometimes rare--hard to diagnose. So, could
someone explain about the Chinon drive and the swap-out policy?
The second item mentioned as if everyone and his cousin knew
about it was the ST Plus. >>>???????????<<< Details?
Thanks for any information sent....

The ARCed set of the new utilities is also available on the Atari Base BBS system run by Atari. The number is 408-745-5308. Expect a 12-24 hour lock-out period (meaning, call back and you should be verified) because of little hackers running amok the system.

>save registers a la GEMDOS and run another process. The blocked reason
>that is kept with each process will tell the dispatcher how the
>interrupted process must resume when it is ready to.

I must admit the idea sounds like it has merit. However it's easy to
try something like this when blissfully unaware of the pitfalls. The
biggest one I see is that GEMDOS itself is not written to be
re-entrant.

You will have to be careful when you implement time-slicing that you
do not suspend a process while it is in the midst of a GEMDOS call.
(You can accomplish this by setting a "critical section" flag when the
trap into GEMDOS occurs. When the time quantum expires, and the
critical section flag is already set, you set still another flag which
indicates that the task should block when it exits the critical
section. When it exits, you clear the "critical section" flag and the
"block on exit" flag, and suspend it). Otherwise, another process
making a GEMDOS call which uses the same data locations will trash the
results of the other task's partially-completed call.

There are probably thousands of such potential problems. I don't even
want to think about the potential for trashing the disk due to

simultaneous updating...

Still, it sounds like fun to play with.

1052. Re: DeskJet Plus weirdness

Newsgroup: comp.sys.atari.st
Date: 1989-08-11 19:28:15 UTC
From: neff@hpvcfs1.HP.COM
Message-ID: <2150015@hpvcfs1.HP.COM>
Source record: 248825

Re DeskJet+ weirdness:

A number of Atari ST users have run into the same situation. DeskJet+ must be on when turning on the Atari. Evidently the strobe line on the Atari is stuck low so the DeskJet+ automatically asserts busy until the strobe line is high. Paul Close has posted a program that gets the strobe line unstuck. Some Atari users have the problem, some do not. It may be that the current sink limitation on the Atari parallel port is aggrivating the problem. One DeskJet+ user said he is using the 7407 chips as line buffers and he has no problems powering on his hardware in any order. It isn't clear to me if he had the problem before he buffered the line. There is no good reason I know that the Atari would be holding down the strobe line -- the strobe line should be strobed :-).

I don't know why some Atari users run into this but others do not. We have a couple Atari ST users here who have never run into this problem (and they are not buffering their lines). I would like to know if the line buffers truly fix the problem or not.

Unfortunately (for you, actually fortunately for me) I am not in product support and do not have the time to work very hard on this problem. Paul and Dianne Close first contacted me about the power on order dependancy and I worked with them on the problem for a while.

Would all DeskJet+ Atari ST users contact me telling me if they do or do not experience this problem (must power on DeskJet+ before the Atari)? If someone had this problem but fixed it with the line buffers would they please let me know. I have no idea why DeskJet users (only DeskJet+) run into this problem. The DeskJet+ should look identical to the parallel port from the standpoint of electrical characteristics and handshaking -- especially when no data is being sent :-).

>I think two issues are being confused here, the need for per process
>memory protection, and the possible to run processes 'simultaneously'.
>Why should memory protection be a hotter item when parallel processes
>are involved?

Because of the potential for a single user program to cause the termination
of all the processes in the system.

Consider: You are a user of the Spiffy multi-tasking-but-no-
per-process-memory-protection Machine. You fire up a ray-trace. It'll
finish in 12 hours so you start up a terminal program and download some cool
PD software from a BBS. While thats all going on "in the background", you
fire up your compiler and start writing a new program. You run your program
and it has pointer error which causes random data to scribbled across memory.
The machine crashes --- badly -- all of the processes on the machine terminate
and the system reboots.

On a machine with memory protection (OK and resource tracking) the MMU will
prevent corruption of other processes address space, and the nasty process can
be removed from the system cleanly.

> In the current situation it is just as well feasible for
>instance by an application program to thrash the space of the shell it

>

I'm all for system robustness for ANY system. My point is that when you
introduce multitasking, memory protection is more important due to the
potential to disrupt other processes.

>An MMU alone probably won't hack it; you will probably want a 680x0
>(x >= 1) to be able to page in new memory (a 68000 doesn't maintain

[Rest Deleted]

I just purchased the 1st Stop Disk Drive for our users group this week. Got it 2 days ago. So what did I get for $149.95? Not much.

The drive itself uses the Toshiba ND-352-TH-A. I had MANY problems with this mechanism when I bought one, so either I screwed up when I tested mine, or 1st Stop didn't test the mech enough.

The case is a hack-job. Looks to have been an old modem case. The front of the drive is smaller than the opening, and the drive moves a little bit. A power switch is on the SIDE of the drive. There is no extra drive port for daisy chaining.

The power supply is an old ColecoVision PS (I use one for my drive) with a 5-pin connector put on it.

When I unpacked the drive, I found a small bit of foam with a handwritten tag on it saying "PULL TO REMOVE". This foam was wedged between the case and the drive mech, and stuck out the front. It's only purpose is to keep the mech from moving around in the case during shipping.

Do I recommend this drive? No. I have SERIOUS doubts about this mechanism. Unfortunatly, the program I used that pointed out the problems with the Toshiba ND-352 (Sub Battle Simulator) was sold some time ago. I'd like to see a MUCH better case (IB Computers sells some nice metal ones), and the option to hook up another drive to this one.

The ST is the best selling personal computer in free Europe, and second in England. Personally, I'd prefer a Sun, but it's an imperfect world and I'm not rich.

Meanwhile, Atari software is powerful, cheap and easy to use. I have not yet seen a DTP program as good as Calamus (I've tried PageMaker on the IBM and Mac), and I like paying ca $100 for Lattice C instead of $500+. If you look to North America, forget it. I read German, so I have the priviledge of being able to use the hundreds of wonderful PD and commercial titles coming out of Europe.

Besides, I love the windows and icons.

>Rich Champeaux (rachamp@mbunix.mitre.org)

I don't see why it should cost more than about $20 to implement a
reasonable memory management scheme on a personal computer like the
Atari ST or the Amiga. It would be real nice to have, especially for
software developers. This kind of personal computer really doesn't
need it though. I seem to crash each computer equally as often when
writing code for them. It takes longer to reboot the Amiga though.
Another advantage to a reasonably implemented memory
protection/management scheme is that the code to relocate executables
before they ran could be eliminated.

[some stuff left out]
|> If a process does a call that may involve some time, like
|>reading a character from the keyboard (Cconin(), Cnecin()), this
|>process only continues its call when there is a character available, so
|>it will not unnecessarily block other processes.
|
|Will you be trapping these interrupts so that you can potentially
|unblock tasks waiting on them?

Not quite, but to the same effect. What in fact happens, is that before the process enters the real GEMDOS function (the handling of Cconin or whatever) but after its context has been saved on its basepage and stack, the system will look at what process to continue with (of course this could just as well be the same process). Processes that are waiting for some state change like a character from the keyboard becoming available, or the printer being ready to receive further data, are marked that way and will only be selected if the state they're waiting for changes (the test for the changed state is just a simple index comparision in most cases). Calls that can be safely assumed to complete within a reasonable amount of time are not marked waiting (although one could perhaps win something by switching out a process that wants to write to disk when the disk is not yet available). When no waiting processes can be served (no state changes) the other processes are searched for the least served one (processes have a priority and a 'serviced' number).

A few problem calls remain: Cconrs(), which reads an entire line from the keyboard. One can at best test for the first character being available, but the user could still take indefinitely to complete his line. Shells that do command line editing, history completion etc. generally won't have a problem, since they typically process their input character by character. A solution would be to rewrite Cconrs() to be re-entrant (no problem since I recently patched Cconrs() to handle a history mechanism, command line editing and file name completion).

[]
|I must admit the idea sounds like it has merit. However it's easy to
|try something like this when blissfully unaware of the pitfalls. The
|biggest one I see is that GEMDOS itself is not written to be
|re-entrant.

Sure, but a) GEMDOS is not being re-entered and b) in a special way, GEMDOS IS re-entrant. After these stunning remarks, I'll have to make myself clear 8-):
Consider a series of programs that call each other by a Pexec(), for instance a shell starts make, which starts a compiler, which ...
Note that each of them only returns from their Pexec after the Pexec'ed program has finished. That program probably did a lot of GEMDOS calls ---> there you have your re-entrancy (in a special way). The whole trick is that, while one process cannot re-enter GEMDOS (it would at least trash registers left on the basepage for the restore of the previous call), multiple processes can very well all be in a GEMDOS call (they're not yet performing their function, only saved their state).

|You will have to be careful when you implement time-slicing that you
|do not suspend a process while it is in the midst of a GEMDOS call.
[story about semaphores, critical sections left out]

But the time-slicing (implemented yesterday evening!) only takes effect when the program was in user mode. This guarantees you're not interrupting any progressing GEMDOS/(X)BIOS/GEM call. Small and beautiful. In fact, my semaphore is the supervisor bit in the program status word!

|There are probably thousands of such potential problems. I don't even
|want to think about the potential for trashing the disk due to
|simultaneous updating...

If there is a problem with this scheme, the problem can be reproduced in the current (unmodified) TOS, so it was already there. As for simultaneous updating, each GEMDOS call is completed before the next is done. No trashing.

|Still, it sounds like fun to play with.

It sure is!! B.T.W. does that sound like an alpha/beta tester :-) ?

Cheers,
Leo.

P.S. The current version screamed for job control, signalling etc. so that's being implemented right now (together with some system calls like signal() and kill()).

|> In the current situation it is just as well feasible for
|>instance by an application program to thrash the space of the shell it
|>was invoked by. So if you insist on security, you should insist on it
|>right now already.
|
| Absolutely correct. But using a multi-tasking system this problem will
|multiply.

A so-called multi-problem system 8-) ? B.T.W. I don't see why.

|
|>An MMU alone probably won't hack it; you will probably want a 680x0
|>(x >= 1) to be able to page in new memory (a 68000 doesn't maintain
|>enough internal information to be able to restore correctly from a
|>BUSERR).
|
| But isn't there any software solution to that ? (I'm looking on primitive
|MMU versions on PDPs where the operating system does a part of context-
|saving work on failed EMT or TRAP recovery). The LSI11 processors are very
|much like the M68k family. Or is this really impossible on 680x0 ? (Remember,
|I'm only a dumb physicist :-))

The problem is that for instance a page fault can emerge whilst in the
middle of an instruction. Whereas the 68010, 68020 etc. store much
information on the stack at a BUSERR (29 words if I'm correct), the
68000 only stores 7 words, which is not sufficient to resume each type
of instruction. For instance:

movem.l (a3),a2-a5

Since this instruction modifies the contents of a3, it cannot be resumed
when a bus error occurs after a3 has been modified (and the instruction
has not yet completed).

Leo.

>question "Is multi-tasking really necessary?" doesn't it?)
>It would, however, be really nice.

Here is a key issue in the multitasking debate: cost vs. performance.
While it is true that you are never going to match the performance
of a system designed (with hardware) for multitasking only through
software, one can come up with some pretty good compromises. Minix
is a good example of this, sure its not as secure as Unix but then
again, security isn't as much of an issue on a single-user system
as it is on a mult-user system. It seems reasonable to sacrifice
some security in order to keep cost down and performance up. (Still
it would be nice if we had the hardware to make it efficient, but
since we don't we must do the best that we can with what we have.)

As for the usefulness of multitasking, it extends not just to the
end user (running lots of programs), but also to the programmer.
Quite often in large applications it is useful to have portions of
the system running in the background.
Clearly it is more efficient and more secure to have this supported
by the OS rather than requiring the program itself to include all
the scheduling and security stuff.
ie. I would benefit (as a programmer) greatly even if only a limited
multitasking were allowed (system calls to provide low priority
background processes). Users would benefit from faster running
programs since the cpu would not have to be left sitting idle most
of the time.

[]
|>I think two issues are being confused here, the need for per process
|>memory protection, and the possible to run processes 'simultaneously'.
|>Why should memory protection be a hotter item when parallel processes
|>are involved?
|
|Because of the potential for a single user program to cause the termination
|of all the processes in the system.

This is equally well possible in the current 'one-process-running-at-a-time'
scheme. Note that there are already accessory-based editors, batch
modem transfer programs, TSR print spoolers for the ST right now.

|Consider: You are a user of the Spiffy multi-tasking-but-no-
|per-process-memory-protection Machine. You fire up a ray-trace.
[etc. good example left out]
|
|On a machine with memory protection (OK and resource tracking) the MMU will
|prevent corruption of other processes address space, and the nasty process can
|be removed from the system cleanly.

I think you'll need a bit more than just an MMU for a secure system.
S'pose your nasty process alters some system vector (applying patch 271
to SAFEDOS). A pity that the last bug was not yet removed... My point
is, that a MMU is a probably undispensable ingredient IN AN OTHERWISE
EXCELLENT SYSTEM. That safe system (which undoubtedly will have a
notion of privileges, users) is what you should start with in the first
place.

B.T.W. what do you do when a thunderstorm is coming up, but your
raytracer has yet to finish its last hour of calculations? Use a TMU :-) ?

[]
|I'm all for system robustness for ANY system. My point is that when you
|introduce multitasking, memory protection is more important due to the
|potential to disrupt other processes.

I heard this one before and I still won't believe it, unless a proper
argument is given.

|>[about VM]
|
|Sounds Good! But now you're wandering into the area of virtual memory and
|that's not what our original discussion was about. Thanks for the reply.

You bought an MMU but you don't want VM? Gee, that would be the first reason I would buy an MMU for (and not for protection). As long as the filesystems used are single-user, not write protectable, I don't care much for safe core.

Leo.

There's a font editor from England which allows you to edit the system font and to type from right to left. I don't remember the name, but the ST club in London should be able to help you. The PD version will do what you want, and the commercial version will edit GDOS fonts as well.

I have read that the ST is the best selling personal computer in free Europe (an archaic term at best), and in England specifically, it is second in sales to Amstrad.

In North America the largest user base is probably around Toronto. A Timeworks sales rep told me that they sell more software in Eastern Canada for the ST than in all of the US. Remember that we have a tenth of the US population...

Forget about the US market. They are still debating whether the mouse is a good thing or whether real men should use line interfaces. I'm surprised that they use a crutch like the keyboard, instead of punch cards or dipswitches!

Software companies have told me that it is better to deal with Atari Canada than Atari US for help in North America, so tell your friend to give Atari Canada a call (I think it's in Markham, Ontario).

MX2 already does a fairly good job of simple multi-tasking. What we need to be able to do is multi-task in GEM. Right now, the machine will crash because the GEM code cannot be reentred when it is being used (it uses global rather than local variables). To multi-task with real ST applications, you would have to at least save all of the internal GEM variables with every context switch.

Well, I use LOTUS 1-2-3 at work (albeit a summer job). When I come home and boot up VIP, I am given the EXACT SAME environment I have at work. Ergo, VIP is for me! I have never used any other spreadsheet, but if you use LOTUS on any regular basis, VIP is the way to go. Also, you can mooch the LOTUS manuals from work and use them at home. :^)

1073. Re: 1040ST Memory Upgrades

Newsgroup: comp.sys.atari.st
Date: 1989-08-13 01:04:02 UTC
From: clf3678@ultb.UUCP
Message-ID: <1143@ultb.UUCP>
Source record: 248846

>>I really don't suggest you get a memory upgrade for the 1040st.
>[very general reason why not]
>Could you be more specific ??

Sure I can. The power supply in the 1040ST was only meant to supply power for 1 meg of chips. Of course, there is a little extra output in the supply (a safety margin of sorts). But since nothing is perfect, and we live in a non-perfect world, not every power supply in every 1040 has the same output. Some have more, some have less, some have the intended output. Ergo, a memory upgrade MAY OR MAY NOT strain your power supply. If Atari had given us a LARGE safety margin, then probably every 1040 could be upgraded. From what I know of the 1040, a 2.5 meg upgrade should be ok. However, your power supply may not be able to handle a 4 meg upgrade. This is why I discourage upgrading the 1040 to more RAM. You just don't know if it will work or not.

This leads into the next question......

>>Of course, you could rig a PC power supply to the ST.......
>HOW !!!!! I've thought about it but what kind and where would it go ??

The Atari 520ST requires the following voltages:

+5V, +5V, +12V, -12V, and two grounds.

A standard PC power supply offers:

+12V, -12V, -5V, +5V, +5V, +5V, and four grounds.

Since the PC supply offers the needed inputs, you can hook one up to the ST. I do NOT know the requirements for the 1040, 520STFM, and Mega, but I would assume they are the same. However, the built-in power supply is probably hard-wired, not having the connector I have on my 520 (external power supply).

The HUGE advantage of the PC supply is the increased power it supplies. My 520 power supply offers something like 15W, where a PC supply can be as high as 250W or so. This allows you to hook up your disk drives, hard disks, and even your monitor (you plug it into the monitor port on the PC supply using an adapter). Theoretically, you could have EVERYTHING on one power supply.

>WHile I'm here ---> Has anybody tried to shove a 1040STf into a tower
>style case ?? They usually come with a pretty hefty power supply....
>Before I spend any money I'd like to know.
> ANdy :-)

I don't believe it possible. The design of a tower case doesn't give you enough room to put in a motherboard. The disk drives would be in the way.

>complete within a reasonable amount of time are not marked waiting

I intercept the BIOS trap vector and add my own routine to do the BConin call. If nothing is waiting in the buffer then I swapout the current process , if a char is is the buffer it is passed on to the calling process and a countdown variable is set to say 100 so that when then next time the buffer is empty it won't swapout until it has checked the buffer a few times.

GEMDOS surely can be made re-entrant. Take a quick look at my MX2 source for an example. I admit my method is not perfect but it works 'sometimes'.

>
> But doesn't the DMA bus limit such a speed if you solder it to an ST ?
>

True. Then again, I'm of the school of thinking that overkill is better
than underkill. The Imprimis drive will get something like 1,050K/sec on
ICD's RATEHD while the ST506/412 drive will get something like 300K/sec.
Real-life benchmarks are probably less glaring in difference but should
still be quite noticable.

I'm curious about the BMS-200 host adapter though. They claim that it
supports a 1.6MB/sec transfer rate but I always thought that the ST's DMA
bus limit was 1.33MB/sec. Or are they measuring it at the SCSI level?

>I hope this convinces everybody that multitasking is possible (even if not
>feasible due to lack of speed) on the ST.

{:-(

Encore une fois:
Multi tasking is possible but USELESS for every-day operation on a machine
where every little bullsh*t program can trash important memory. You definetely
CANNOT shrink a system's kernel PLUS working variables completely into 2048
bytes. BUT THAT'S ALL PROTECTED MEMORY YOU HAVE ON AN ST. Oh, sure, you could
execute what's in the hardware registers.
I don't want to think about wasted time during software debugging on a
machine where ANY program can produce unpredictable and perhaps unreproductable
reactions of ANY program running on it (INCLUDING THE OPERATING SYSTEM ITSELF)
if it's not coded correctly. (Maybe your printer daemon crashes the system
every time you print more than 42 asterisks).
It is not neccessary at all that YOU are the source of this behaviour, some-
one else who has written a program currently running in your system's background
could be the cause ! Perhaps YOU WILL NEVER KNOW !
If you have an MMU and if your 'crash exception handler' is working correctly,
only the nasty program will die WITHOUT affecting others. Because of that you
can exactly determine what's going wrong there.

Of course, this is not only relevant for multi tasking systems on the ST but
for all multi-program environments on this machine (including TOS). BUT it's
a matter of fact, that multi tasking means multiplying the probabilty of crazy
system behaviour !

1078. v07INF1: Introduction to comp.binaries.atari.st

Newsgroup: comp.sys.atari.st
Date: 1989-09-12 15:40:08 UTC
From: koreth%panarthea.ebay@sun.com
Message-ID: <34260@grapevine.uucp>
Source record: 246109
Cross-posted to: comp.binaries.atari.st,comp.sys.atari.st

```
Submitted-by: koreth%panarthea.ebay@sun.com (Steven Grimm)
Posting-number: Volume 7, Info 1
Archive-name: intro

This is the first of three introductory articles about comp.binaries.atari.st.
This one describes how to submit binaries to the newsgroup. A companion
article lists all previously-published binaries, and a third article explains
how to retrieve and unpack binaries.

I am always looking for suggestions on how to improve the usefulness
of the newsgroup, and can be contacted as listed below.

-- Steven Grimm
sgrimm@sun.com

--------------------

Subject: Submitting binaries for publication

Items intended for posting or queries and problem notes should be sent to
atari-binaries@ssyx.ucsc.edu. If you are on a UUCP-only site, you can send
them to uunet!ucbvax!ucscc!ssyx!atari-binaries.

If you want verification of arrival, so say in a cover note, or at the
beginning of your submission, if it is small. I try to verify that a
program works, and if I can't get it to work, I may hold up posting it
for a couple of days. Please note that, except in rare cases, software
without documentation will not be published. The backlog from receipt
to posting varies from one to four weeks depending mostly on the set
of submissions currently in my queue.

If you are submitting both sources and binaries, please send the two
separately. If I have to separate your sources from your binaries by
hand, your submission will most likely sit on the back burner for a
while.

--------------------

Subject: The structure of comp.binaries.atari.st articles

Each posting in comp.binaries.atari.st is called an "issue"; there are
roughly 100 issues to a volume. The division is arbitrary and may vary.
There are two types of articles in comp.binaries.atari.st: binaries and
"information postings." They can be distinguished by the subject line:

Subject: v07INF2: Index and other info
```

This first word in the title identifies this as the third info posting of volume six. Similarly, the subject line shown below:

Subject: v07i081: fix40 -- Fix for forty-folder bug

identifies this as the 81st binary article in Volume 7. Large programs are broken up into smaller pieces, and have subject lines that look like this:

Subject: v07i041: mtgem -- Multitasking GEM replacement part04/18

Certain information about the system configuration required to use the program is given on the keywords line.

Keywords: uuencode, 1meg, medium, high

This means that the program requires at least one meg of RAM and runs in medium or high resolution. Following is a list of keywords; new ones may be added as needed. They are mostly self-explanatory.

uuencode - program is uuencoded (UNIX uudecode required to unpack)
uue - program is uuencoded (ST uud required to unpack)
arc - program is archived (arc required to unpack)
zoo - program is a zoo archive (zoo required to unpack)
high - high resolution
medium - medium resolution
low - low resolution
1meg - needs 1 meg of RAM

The first few lines of an article are auxiliary headers that look like this:

Submitted-by: good@atari.UUCP (Roy Good)
Posting-number: Volume 7, Issue 80
Archive-name: new-desktop

The "Submitted by" is the author of the program. If you have comments about the binaries published in comp.binaries.atari.st this is the person to contact. When possible, this address is in domain form, otherwise it is a UUCP bang path relative to some major (backbone) site.

The second line repeats the volume/issue information for the aide of notes sites and automatic archiving programs.

The Archive-name is the "official" name of this program in the archive. Large postings will have names that look like this:

Archive-name: desktop/part01

Since most archive sites run UNIX, articles are given UNIX-style filenames rather than ST-style filenames. I do make an effort to keep filenames to 8 characters or smaller, however.

Subject: Reporting and tracking bugs and patches to postings

Updates to programs are usually announced in comp.sys.atari.st. When large changes are made to a program, the entire thing will be reposted to comp.binaries.atari.st.

To report bugs, contact the person listed in the Submitted-to header. Often there is a contact address in a README file, too. I do not maintain the programs I moderate, so don't send your bug reports to me.

If the program documentation mentions some file that isn't included in the posting (for instance, a font editor's documentation might refer to some sample fonts), contact the submitter, not me. I post articles in their entirety, so if it isn't posted, I probably don't have it.

The Macintosh Portable is 15.7 pounds with a built in 40Mb hard disk. (It's 13.7 without the hard disk.) Also, the small size of a Stacy might be considered a disadvantage, depending on how the keyboard feels and how big the screen is.

Michtrons Hard Drive Turbo Kit makes all of the files on the hard drive contigous. It then uses one of two algorithms (selected by the user) to make the free blocks contigous. As far as interleave, I was under the impression that the Atari ST with its DMA port operated at an interleave of 1:1 anyway, so this doesn't need to be worried about.

If I'm wrong, tell me.

>Can anyone give e any pointers in the right direction or even sources
>for such boards.

I don't know about build-it-yourself kits, but Alpha Systems makes a line of RAMboxes that plug into the cartridge port. Can be sized from 512K to 4Meg, with or without battery backup and clock. I have a 2Meg Ultradisk with battery backup. This thing is pretty cool, expandable to 4Meg. You can configure it for however many disk partitions you want, and can make a partition bootable as well. I really like this feature, because I tend to leave my hard drive off (too noisy) and I can stick auto-boot progs onto that cartridge instead. You can also allocate up to 60K of the memory as a printer buffer, which I've found to be pretty handy. No point in eating up main memory for that...

Anyway.... I really like mine. Too bad I probably can't use it with any other cartridge gizmos...

Obligatory disclaimer - I'm not related to Alpha Systems in any way other than as a satisfied customer...

>Find a 6-wire telephone cord with modular jacks at each end.
>*poof* - instant cable.

If that works, I'm really surprised. The Megas I know of need a slightly different cable. You have to turn one connector of a standard phone cable upside-down. I know because I had to make my own once and I couldn't use a phone cable out of the box. Maybe new Megas or old ones are the way you describe...

Normal phone cable:

```
------ ------
1 |---------------|6
2 |---------------|5
3 |---------------|4
4 |---------------|3
5 |---------------|2
6 |---------------|1
------ ------
```

Mega Keyboard cable:

```
------ ------
1 |---------------|1
2 |---------------|2
3 |---------------|3
4 |---------------|4
5 |---------------|5
6 |---------------|6
------ ------
```

If you buy the cable without the ends, you can make the Mega keyboard kind easily. If you don't, it's hard: the ends aren't made to be taken off & rearranged, they're made to crimp on once & stay forever. (TPC sure knows how to build to last: they didn't want to have to go back and do it again, back when they handled all repairs and we were just renting.)

>RS-232 port work. Is this true?

This is true, but only some people will come up against it. RTS/CTS is a hardware flow-control protocol which high-speed modems use, among other devices. If you don't use it, you won't know there's a problem.

The problem is not in the RTS/CTS code per se, but the code which enables that flow-control mode. Mea culpa. TOS14FIX.PRG or whatever it's called fixes that, and it's available on GEnie and other places, with notes to the effect that it should be widely distributed. I'll let Kbad post it here if he wants: he wrote it. The fix program also fixes one other bug (in the AES Shel_ library) and has a mouse accelerator and screen saver.

>> point me to a reference?
>
>Use Rwabs(rorw,buffer,n,rec,drive)
>

I appologize. I hadn't worded my aritcle correctly at all. What I really want to know is how I can write sector level access routines which call things like Rwabs() to access files. How can I find out the mapping of files->sectors. I assume this is an intrinisic part of the directory structure, unfortunatley I can not seem to find anything describing how this works. A piece of sample code which uses rwabs() to access a file would be nice. A description of this would also be nice. And if nothing else, a pointer to a reference which describes this would also be appreciated.

Thanks!

The Portfolio is available in the US. My local dealer, San Jose Computers, picked up 12 the other day when I was at the Atari warehouse picking up some loaner machines for a local show. I got one to demo and it is neat. The extra stuff available now is the memory cards which are available in 32, 64, and 128K sizes. Just FCC approved last week is the computer interface{ serial and RS-232 port. They are supposed to be for sale in October. The system looks just like the IBM at work, in use. Typical Messydos commands. Fortunately for the average user there is a built in menu that runs the ROMed applications which are Setup, Diary (with date alarms, etc.), Editor, Spreadsheet (Lotus 123 compatible), and address book.

:
:Would someone from HP please, at least unofffically, respond to this issue?
:
:| Jeff Long jlong@afit-af.mil (ARPA net) |

Yes and No. My information comes from an HP publication that is circulated internally to HP. One of the issues was devoted to the developement of the DeskJet, it's ink cartridge, paper movement systems, electrical systems, user interface systems, etc. I am not speaking "officially" for HP.

You are right when talking about an "electrical drive signal" that ink into the jets, sort of. The jets get heated and force the ink to eject in rapid succession.

However, the pump I'm talking about is not in the cartridge, but in the body of the DiskJet. If you open the DJ up, you will find on the righ-hand side, the cam and tube I'm refering to. Each and every time the DJ begins to print, the cartridge head wipes across a rubber wiper. Next to this wiper is the opening is where the cartridge rests. This is where the tube sucks the ink to "prime" each printing.

Like I said, the new ink may work fine, but I hear HP is developing a DJ approved water proof ink, so I'll wait and see.

If you can get you hands on this HP circular (about 40 pages?) it makes very interesting reading. They really pulled off a mechanical coup with the DJ.

1091. details of 1-pass Modula 2 package

Newsgroup: comp.sys.atari.st
Date: 1989-09-26 04:43:25 UTC
From: saj@chinet.chi.il.us
Message-ID: <9670@chinet.chi.il.us>
Source record: 248713

A couple questions about the 1-pass Modula 2 package (the free one from Germany).

One of the replacement keystrokes for a menu selection is <control>U-umlaut (or was that A-umlaut: memory failure again) anyway--can I enter such a character on a US keyboard?

The read.me file in the distribution seems to imply that I have more ability to customize the editor than choosing either m2editor or Tempus. Would someone care to comment on that?

Thanks, people.
Steve J.

>then the Mac SE anyway.
Dunno 'bout the rest of the stuff you mention, but the specs I saw said
that the Mac portable will have a 640x400 LCD screen. I'm inclined to
believe that they're using identical display technology. They just don't
call it the same because Apple likes to lead the public to believe that
everything they do is new, innovative, and original... As long as the world
doesn't see anything else comparable, then Apple doesn't have any trouble
charging whatever the hell they feel like. If the STacy doesn't flood the
US market soon, it'll never get a chance, because most people are too willing
to swallow the Apple PR junk.

I suppose one other significant difference would be that the portable Mac
has Localtalk support. Of course, if you think one little Zilog Z8530 is
worth the $3500 price difference... }-)

Hm... Oh yes, the Mac portable is much larger, it's not billed as a "Laptop,"
as the STacy is named. The Mac uses a faster CPU, 16MHz. It really does look
like Apple has some good ideas in this box. The STacy will basically be a
Mega redesigned to fit in a smaller case... I suppose, given that, Atari still
may not grab a very sizable chunk of the laptop market. The Mac is a relatively
open system, compared to the STacy. You can expand the memory just by dropping
in more SIMMs. I think the STacy would require tedious brain surgery... Of
course, a strike against the Mac - the portable's expansion slot uses yet
another different design. So now Apple has Macs with funny NuBus slots, weird
SE slots, and weird Portable slots. This sorta puts it on even ground with the
STacy, since its Mega slot is also not an industry standard. The sad thing is,
tho, I bet there'll be lots of products for the MAcPortable's slot developed
very quickly... So it goes.

Gawd, what a depressing article. Sorry. If you can prove any or all of what
I've just said to be grossly untrue, please do, I'd feel much better for it.

I wanna know how to do this too!
I know that on real Macs can hold down a key combination (OPT-K?) to produce
Postscript files but unless you can install a postscript driver in the first
place then your sunk. I have never manged either on Spectre 128.

1097. Supra 45M bootup

Newsgroup: comp.sys.atari.st
Date: 1989-09-26 09:16:37 UTC
From: rmanzie@miclon.uucp
Message-ID: <1989Sep26.091637.11817@miclon.uucp>
Source record: 248719

I have a Supra 45 Meg hard drive which never seems happy waking up when
my 1040ST (unmodified, non-1.4-TOS) boots.

The supra is always up & running well before I turn on the ST.
If I have a floppy in the floppy drive on bootup, it always boots from
the floppy. If no floppy is in the floppy drive, it will boot from ROM
(eventually).

However.

If I switch the supra OFF while the system is booting with no floppy in
the drive, the desktop comes up IMMEDIATELY. If I then switch the Supra
back ON, wait for it to spin-up then hit the reset button on the ST, the
it tries the floppy about three times then autoboots correctly from the Supra.

After this elaborate sequence, everything works according to the Supra manual.
Rebooting with or without floppy in the drive gets an autoboot from the Supra.
It is only on Cold Start that these problems occur. The Supra is set up as
per the manual for auto-booting.

Has anyone seen this before? Is this problem going to go away when (if)
TOS 1.4 becomes available in the UK (another story...).

Thanks in advance for any help,

Roddy.

1098. Portfolio info requested

Newsgroup: comp.sys.atari.st
Date: 1989-09-26 10:16:45 UTC
From: portuesi@tweezers.esd.sgi.com
Message-ID: <PORTUESI.89Sep26111645@tweezers.esd.sgi.com>
Source record: 248720

After reading the press blurbs about the Portfolio, I've decided that it might be what I'm looking for. Nevertheless, I would be grateful for answers to the following questions, from somebody who knows more about the Portfolio than I do:

1. Does the Portfolio have a serial port? What is the highest baud rate supported over the serial port?

2. What kind of memory technology does the 640K expansion use? How much will it cost to upgrade a Portfolio to 640K?

3. Is there an optional external floppy drive?

4. What is the storage capacity of the external memory cards? How much does a memory card cost? What is the I/O speed of these cards?

5. Does the Portfolio offer any sort of graphics capability? Can the display handle inverse video and the IBM graphics character set?

6. Is the bundled software included in a built-in ROM, or does it come on memory cards?

7. What version of MS-DOS does the Portfolio use? Is MS-DOS built into ROM? Are external MS-DOS commands also built into ROM?

8. The Portfolio supports a 40x8 virtual view onto an 80x24 screen. Is it possible to make applications which simply use the 40x8 physical screen only? I would prefer to see only a little bit of a document rather than a scrolling view of one-sixth of a standard display.

9. Do MS-DOS programs that assume a monochrome display adapter and simply blast bytes into display memory work on the Portfolio?

10. How long does the Portfolio run on three AA alkaline batteries?

Email responses would be preferred, as I don't normally read this group. I would be more than happy to send summaries to interested parties, and if I receive enough requests I will post a summary to the net.

1099. AES/VDI - Help!!! I'm confused!!!

Newsgroup: comp.sys.atari.st
Date: 1989-09-26 11:19:43 UTC
From: loki@moncam.co.uk
Message-ID: <LOKI.89Sep26121943@marvin.moncam.co.uk>
Source record: 248721

I've read as many different definitions of AES/VDI as I have documents on these chaps, and my head is in danger of falling off. I've looked at the Sozobon library sources, and it would appear that AES calls are made with a trap #2, with the AES opcode in d0 and some kind of parameter in d1. However, my VDI manual says you need to set up a parameter block consisting of pointers to a control array, an input parameter array, an input point coordinate array, an output parameter array and an output point coordinate array, with the opcode in the first byte of the control array, and bung that into d0 - nothing about d1 mentioned here - and then do a trap #2.

I have a complete, if obscure, description of VDI, but NOTHING on AES apart from the code in crystal.s in the Sozobon library, which gives a list of function numbers, but not what they do. I therefore have no idea how to call AES.

Sooo...

(1) do I have AES or VDI? I'm running a very early TOS.

(2) do AES and VDI differ in the ways I have described above, or have I misread something?

(3) Can anyone give me a help file, or even a source listing for AES, so that I can actually use it?

(4) Books? Will Abacus' ``GEM Programmer's Ref'' help me out with AES?

Thanks in advance to anyone that can help.

[deleted]

I haven't listened to the discussion so far, but if you need a PD lex or yacc
for the ST, there should be no problem. I have heard of a PD yacc called
"bison" (obviously a GNU port) floating around somewhere, and my port of
flex (=lex) appeared in comp.binaries.atari.st only some weeks ago.

There was a newer version of flex in comp.sources.unix recently, and I think
you will have no trouble compiling it on the ST (e.g.,with Sozobon).

If you cannot get at these goodies, feel free to contact me and I will send
you a disk.

> Well, I *MAY* have been wrong about the Portfolio. I have been told by several
> Atari dealers that they are getting 12 Portfolios per dealer this month.
> So, maybe the drought of new Atari products is about to end!!

Same here. The dealer in this area told me that he'd be getting 12 Portfolios.
He didn't say *when*, though. When, exactly, can we expect them to arrive?
I don't want to keep trekking over to the dealer only to find they haven't
arrived yet!

On a different note: If you really squeeze your fingers together, can you
do "10 finger typing" on the Portfolio? If yes, I will probably get one. If
not, I probably won't...
If you can't do the above, I think it would be a shame. I wouldn't think that
much more space/resources would be needed to have a "usable" QWERTY keyboard.
In fact, I'd rather have a $499 Portfolio with usable keyboard than a $399
Portfolio that can only be used with two fingers. Does anybody have similar
feelings?

Tom

Books on MSDOS which cover the filesystem (GEMDOS is modeled
after MSDOS):

Programmer's Guide to the IBM PC -- Peter Norton, Microsoft Press

Advanced MSDOS -- Ray Duncan, Microsfot Press

Microsoft MSDOS Reference Manual (also available from IBM)

Most good bookstores should have the first two books, good
computer stores should carry the last (check IBM dealers). All cover
the logical layout of the MSDOS filesystem, GEMDOS is almost 100%
compatible (GEMDOS ignores some fields that MSDOS cares about).

You also might want to check out the back issues of STLog
magazine, Dave Small and I had an article on CHK in it about 18 months
ago. CHK is a GEMDOS/MSDOS filesystem tester, it includes code to do
logical (ie. file level) to physical (ie. sector level) translations.
The C source and binary were on the disk included with the magazine.

1104. I have an Atari Portfolio

Newsgroup: comp.sys.atari.st
Date: 1989-09-26 15:32:00 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8909261549.AA25844@ucbvax.Berkeley.EDU>
Source record: 248726

At last, I have a Portfolio in my hands; this is not vapourware! I posted the following notice on my company CYBER and VAX system to describe what I know about the little marvel so far.

The Portfolio arrived

Yesterday I received an Atari Portfolio, the first DOS/IBM-PC << hand-held>> computer. It is about the size of a VHS video cassette. It has an 8 line by 40 character LCD display (screen contrast control is through the keyboard).

The keyboard has 10 function keys, ctl and alt keys, home, pg up, pg dn and end keys, keys that double as a numeric pad, arrow keys, caps lock (with on screen status), tab and esc keys.

The "Atari" key is used to call up the resident, menu driven applications manager. Resident applications can also be invoked directly (e.g. "Atari" key + W invokes the spreadsheet program).

The following is a quick overview of some of Portfolio's features:

1. DOS extensions

- APP (parameters = /A /C /D /E /S /W)
a=address book
c=calculator
d=diary (full calendar with alarms)
e=text editor
s=setup (e.g. the RS232 port)
w=worksheet

- HELP (what every DOS should have had)
this lists DOS commands

- OFF (turns the Portfolio off)

- I/O redirection
e.g dir > dir.txt routes a directory listing to file

2. menu driven resident applications

- layered menus
- dialog boxes
- common f-key defs across apps
f1=command menu
f2=help
f3=clipboard
f4=undo

f5=toggle screen frame (shows time/date/status)
f6=reserved
f7 -> f10 app specific
common ctl/alt key functions

3. address book has a telephone dialer

- hold Portfolio up to a pulse dial phone and the tones
from Portfolio's speaker will dial the phone

4. diary has a full calendar for noting appointments each day
and for ringing alarms

5. spreadsheet that reads/writes 123 files (see fn list below)
- since the sheet has a subset of 123 fn, not all 123
sheets can be read in as-is. The 123 fn supported are:

ABS, ACOS, ASIN, ATAN, ATAN2, AVG, CHOOSE, COS, COUNT, DATE
DAY, ERR, EXP, FALSE, HLOOKUP, IF, INT, IRR, ISERR, ISNA
LOG, MAX, MIN, MOD, MONTH, NA, NPV, PI, PMT, PV, RAND
ROUND, SIN, SQRT, STD, SUM, TAN, TODAY, TRUE, VAR
VLOOKUP, YEAR

Anyone who crabs that NOT ALL 123 FN are supported should try
and use 20/20 on the VAX mainframe - it also lacks full 123
compatibility.

6. THE BATTERIES ARE INCLUDED !!!!!!!!!!

There will be an informal Atari Users' Group meeting in Building
600 at 12:30 to 13:00 Fri Sept 29th to view the Portfolio. See you there!

1105. Software for sale(complete)

1106. ATTENTION SPECTRE 128 OWNERS with fast SCSI drives

Newsgroup: comp.sys.atari.st
Date: 1989-09-26 17:09:21 UTC
From: Z4648252@SFAUSTIN.BITNET
Message-ID: <890926.11092003.048625@SFA.CP6>
Source record: 248728

As David Small said, some fast SCSI drives will require the slow
SCSI option to be selected. Otherwise, one is liable to get read/write
errors, etc. With the slow SCSI option, the problems are cleared and
the performance is not that much slower but it is slower than an ATari SH 204!.
However, if a Spectre 128er is in a university environment where
other systems abound and the 128er is constantly under examination by
real MACers, then SLOW becomes the S word. He will want to push his
emulator 'to the envelope' without crashes and errors.
I'm using the SeaGate 296n. Yeah, I've been reading all the talk
about interweave problems and ROM bugs, but even at 2:1 interweave,
the mechanism is still fast. It is so fast, that slow SCSI option has
to be selected. For my system, that slows things down so much, across
the board, that my hard drive I/O results in access slower than my
creaking SH 204 hard drive!!!
Ok, there is a solution. Very easy, in fact.
Note that I don't have the GCR....
By getting rid of SoundMaster and Magic Beep, one can have a toggle
that will slow down the emulator. Yep, it is the sound toggle, the
ESCape key. Select 11 for the sample rate, as David says. You get
rid of SoundMaster and Magic Beep because they hang and give uncontrollable
results when the sound option is selected.
What happens now is that we get David's 'OOGAH' beep. Fortunately,
there is NOTHING in the system now that will cause the system to remain
slow once a beep occurs, as it would if we left SoundMaster on.
Also, and fortunately, via the aforementioned ESCape key toggling,
we can now slow the emulator down. This means that large files, which are
a minority anyway, will transfer and boot up.
For a test, I attempted to transfer FullWrite (awesome program [!!])
to another partition while in fast SCSI. Nope, it choked. No problem,
press the ESCape key. Yep, it transferred just fine. In fact, one
can tap the ESCape key a second after the transfer occurs and return to
fast SCSI mode for a faster transfer.
Excel caused crashes in fast SCSI. Tap the ESCape key. Yep, it
boots up just fine. After it loads, just tap the ESCape key again to
return to fast SCSI. No problem.
Just experiment with your large files and you too can keep your
fast SCSI option across the board. No more of this creaking-running-
slower-than-an-SH 204 while using a 296n.

1108. Re: Problem with Disks

Newsgroup: comp.sys.atari.st
Date: 1989-09-26 17:31:19 UTC
From: iadt3tb@prism.gatech.EDU
Message-ID: <2075@hydra.gatech.EDU>
Source record: 248730

In article <1985@hydra.gatech.EDU> iadt3tb@prism.gatech.EDU (T. Terrell Banks) writes:
}
} I can't figure it out, someone please help!
}
} I have a MegaST2 with no hard disk. I use an IBM system at work.
}
(stuff deleted)

} To state it simply - Atari can read IBM written disk and files, IBM
} can not find files written onto a disk by my Atari even though it (IBM)
} can use the disk just fine. What is happening, why, and how can I fix it?
}

I found the answer to the problem I was having with the Atari
not correctly writing on a disk for IBM to read. I thought the net might
be interested in the answer.
I was virus infected! The virus was one of those boot-sector
executable things. It just installs itself in the operating system so that
any time the media-change call is made the virus makes sure that the disk
is infected. Nothing else will happen until some unknown trigger comes
along in a new infection and then the old virus will trigger the new one
(or vice versa). This virus just happened to do something to the disk
that caused the IBM to be unable to find any valid files but the Atari
still thought that everything was OK. All of the common virus dectector/
killer programs that I found found this thing and then could remove it.
Damn near every disk I had had been infected by the time I found out what
was going on.
Every thing works just like it should, now.

Cheers,
Terry

1109. Colors on the ST: Display more than 16???

Newsgroup: comp.sys.atari.st
Date: 1989-09-26 17:53:19 UTC
From: whack@nmsu.edu
Message-ID: <335@opus.NMSU.EDU>
Source record: 248731

This is my first posting, so ...

I am presently engaged in research (as a grad student) which will involve image processing. With the capabilities of the ST which I own, I am looking into porting a program from the realm of the PC's and clones. My problem arises when I want (need !!!) more than sixteen colors to display the images in.

I have heard that displaying 512 colors is a fairly straight-forward piece of programming involving interrupting the raster scans of each line to change the pallete. Unfortunately, I have only limited programming experience. Surely someone out there can provide me with the source code (or interrupt calls in C) to accomplish this task. Also, I am not clear what resolution this would be working at and would need this as well. Spectrum 512 software* would be fine (or Quantum Paintbox with 4096 colors) would be great if only I could use the palletes for my program.

Please, anyone, e-mail me a way to do this or where I can get software that is PD/SW/comm to do this, my research and dissertation would be eternally grateful.

* I am not affiliated in any way with these fine products, except as someone who has seen these programs in action for a short time.

P.S. From what I hear, the Elmtech board would be perfect except for the $$ Any more info, though???

> Save your self the development time and cost. Just buy a MegaDisk or
>UltraDisk (ramdisk cartridges) from Alpha Systems. They already exist.
>Are reasonably priced. And they work great right out of the box. You
>can also buy a clock and/or battery backup option. ...

Believe me, if I had $300 to "Just buy" a MegaDisk, I still would
save my money for a few months more and spend $570 for a 20M HD.
I know this may sound like nitpicking, but as I college student, if
I can put in the extra time myself and save a few bucks...it's worth
all the development time. I am just interested in finding out how
others may have gone about designing and writing software for this
project.

I thank you for your offer, but unfortunately, it won't work for me.

Any other ideas, anyone?

1111. 1040 MMUs & memory expansion

Newsgroup: comp.sys.atari.st
Date: 1989-09-26 20:03:14 UTC

>that newer Mega ST2s aren't wired for 4 megabytes of memory (no solder traces
>running to solder filled holes like in my 18 month Mega ST2). this makes sense,
>since Atari has No Offical Upgrade for the Mega ST2.

I recently upgraded my 1040 to 2.5 megs, and heard from the person who installed it that Atari is now shipping 1040s with MMUs that only address one meg! So if you have one of these machines, you can add an extra $30 or so for a new (rather, old) MMU!

This really surprised me! Imagine, going to all that trouble to manufacture special MMUs just to stop people from upgrading their machine!

BTW, I got one of the new Zubair boards (Installed by Mr. Zubair himself!), and they are great! The whole board fits in the metal box (without the lid) where the video shifter chip sits. I was very impressed with his technical expertise, and would recommend this board to anyone looking to upgrade an ST. He also guarantees any installation he does for one year (he charges ~$35 if you have a suitable MMU). The same board is used to upgrade to two or four megabytes, and all are tested to four megs.

Now that 1 megabit chips are in the $10-$12 range, a memory upgrade can be quite affordable. My total cost for a 2 meg upgrade was under $350!

I have no affiliation with Zubair Industries, Inc., other than being a happy customer. Aren't these disclaimers silly?

P.S. I would recommend against installing a memory board yourself. I am very technically competent, and I was amazed at how much can go wrong. One little short and NOTHING works! Also, the ST is a VERY noisy machine, so keep those cables short! I don't mean to scare anyone, but ask yourself what you will do when it DOESN'T work!

The problem isn't too much of a task. I have seen kits for the crimp on
modular plugs for telephone cables at my local Radio Shack. Using a
standard telephone extension cable, Just cut off the end, peel, strip the
wires and crimp on a new piece. That should take care of it. In just a
few minutes, you would have a an extension for your keyboard. And
if you should ever get bored with it, you still have a perfectly usable
telephone extension cord.

I've been refilling my hp carteidges for about 6 months now, and,
last weekend, my dj stopped printing. I put in a brand new cartreidge
that had an expiration date of 12/90 and it printed about 10 pages
and then died. Ususally when the cart. is running out of ink, it
starts skipping and printing lightly. This time, it just stopped
printing all together. I cleaned it as well as I could, but, alas,
nothing. I am trying to get it repaired now.

I hope I didn't break it by refilling; but I may have. :-(

1115. Atari PC Portfolio is In

Newsgroup: comp.sys.atari.st
Date: 1989-09-26 22:53:37 UTC
From: covertr@force.UUCP
Message-ID: <45e06c0f.14a1f@force.UUCP>
Source record: 248737
Cross-posted to: comp.sys.atari.st,agcs.pc.ibm,agcs.pc.mac,agcs.pc.atari.st

Well, Computers Work at 41st Ave and Bethany Homes Road (in Glendale AZ)got the new Atari PC Portfolio in today. The 'folio is an MSDOS computer the size of a VCR tape. It uses a 80c88 cpu and has MSDOS 2.11 (or close to that) in ROM. It uses a 8x40 screen to scroll through a 24x80 window. So, if you are interested in a new neat gadget call Computer Works at (602) 246-6364 and ask for Jeff or Henry.

The following prices were from a previous USENET article and may not reflect reality:

Portfolio w/128K RAM and 256K ROM $399.95
Software includes word processing, Lotus-compatible spreadsheet, appointment calendar, phone database, autodialer.
Ram cards: 32K $79.95
64K $129.95
128K $199.95
Smart parallel Centronics interface $49.95
Serial interface (RS-232) $79.95
Memory expander plus
(256K RAM memory + second card drive) $229.95
PC Memory Card drive
(Read/write memory cards with a PC Avail 10/1). $99.95
AC Adapter-117V $9.95
AC Adapter-220V $9.95

P.S. I am a techno junkie and may buy on myself. Gonna take a look at it tomorrow!!

> array and an output point coordinate array, with the opcode in the
> first byte of the control array, and bung that into d0 - nothing about
> d1 mentioned here - and then do a trap #2.

The AES procedure is to place a parameter block pointer in d1 and a "magic number" of 200 in d0. All the function-specific information is contained in the arrays. You probably could do the whole set of bindings with the C preprocessor if you drank enough coffee.

> I have a complete, if obscure, description of VDI, but NOTHING on AES
> apart from the code in crystal.s in the Sozobon library, which gives a
> list of function numbers, but not what they do. I therefore have no
> idea how to call AES.
>
> Sooo...
>
> (1) do I have AES or VDI? I'm running a very early TOS.

Yes. Absolutely. Even "thelake Mark 1," my homely 1985-model ST that died last year, had it.

> (2) do AES and VDI differ in the ways I have described above, or have
> I misread something?

AES is a library of high-level services. It is implemented in ways that are similar to that of the VDI, but they are quite distinct. For details, see below.

> (3) Can anyone give me a help file, or even a source listing for AES,
> so that I can actually use it?

Ask the archive-server%panarthea@sun.com to send you Ian Lepore's GEMFAST AES/VDI libraries, which work with Sozobon C, Laser C, Alcyon C and/or MadMac assembler. Source code is available as well as the bindings libraries. All you have to do is call the proper functions and link the

GEM libraries at compile time. It's free.

I wrote an almost complete GEM AES binding library in C when I was testing a prerelease copy of the Sozobon compiler. It was not hard, just tedious. Before I got around to grappling with the VDI, I discovered a set of Alcyon-compatible bindings written in assembler by Don Farmer, so I gave up the project. No use in reinventing the wheel.

I now use Ian's bindings 90% of the time, and fall back on Don's when I get hit by a bug. Ian's bindings are more complete and generally are smaller and faster.

For curiosity's sake, here is some source code from my original bindings.

Before you read it, consider: (1) I am not a registered Atari developer, just a basement hacker. (2) I am not a professional programmer. (3) I only took one computer science class in my life, and that was back in the days of the Commodore PET. (3) I do not always know what I'm talking about, but the code seems to work. (4) I had intended to get around to commenting and documenting the following, but didn't. There's an object lesson in there someplace.

```
O/
--cut here O\---------------------------------------

/************************************************

int_in[0] = aptnum;
int_in[1] = aptscale;
return _aesop(14);
}

WORD appl_trecord(aptmen, aptcount) char *aptmen; WORD aptcount;
{

addr_in[0] = aptmen;
int_in[0] = aptcount;
return _aesop(15);
}

WORD appl_exit()
{
return _aesop(19);
}

O/
--cut here O\----------------------------------------

/* aeslib.h -- included in all modules except for appl_* module */

#ifndef WORD
#define WORD int /* 16-bit value */
#endif

#ifndef OBJECT
#define OBJECT char
#endif

extern WORD control[4], global[15], int_in[16], int_out[7];
extern char *addr_in[2], *addr_out[1];

O/
--cut here O\----------------------------------------
```

```
/*************************************************************************
The AES file selector library
*************************************************************************/

#include "aeslib.h"

WORD fsel_input(ipath, isel, iexbutton)
char *ipath, *isel; WORD *iexbutton;
{
addr_in[0] = ipath;
addr_in[1] = isel;
_aesop(90);
*iexbutton = int_out[1];
return int_out[0];
}

O/
--cut here O\---------------------------------------
```

Anyway, you get the idea. Basically, each function stuffs its arguments into the proper array "mailboxes", then calls _aesop, which looks up the AES control codes from the _cntrl_cnts: array in crystal.s, then puts the AES parameter block address on the stack and calls crystal. (crystal itself is commented out in crystal.s; you should restore it if you want to roll your own library.) The AES parameter block is an array of pointers to the various mailboxes. I think control[1 .. 3] contain the number of ints, points, addresses to be supplied. (If I had written a few comments here I'd remember, wouldn't I?)

Here's aesop.c:

```
O/
--cut here O\---------------------------------------

#include "aeslib.h"

extern char ctrl_cnts[115][3];

WORD *aespb[6] = {
control, global, int_in, int_out,
(WORD *)addr_in, (WORD *)addr_out};

/*
* function _aesop(opcode)
* sets the control arrays, kicks AES into action,
* and returns int_out[0] for good measure.
*/

WORD _aesop(opcode) WORD opcode;
{
register int x;
x = opcode - 10;
control[0] = opcode;
control[1] = (int) ctrl_cnts[x][0];
control[2] = (int) ctrl_cnts[x][1];
```

```
control[3] = (int) ctrl_cnts[x][2];
crystal(aespb);
return int_out[0];
}

O/
--cut here O\----------------------------------------
```

All the above is the result of my tinkering, plus the encouragement and moral support of dal and jls, and is in the public domain. If there is sufficient interest, I can post the whole AES library (minus a couple of unimplemented functions) to comp.src.atari.st.

1119. Re: GEM data file image format wanted.

Newsgroup: comp.sys.atari.st
Date: 1989-09-27 02:57:36 UTC
From: saj@chinet.chi.il.us
Message-ID: <9679@chinet.chi.il.us>
Source record: 248741

STWorld has a description of the GEM .img format in the July 1989 issue. It contains some slight ambiguities, so I'd start out reading files for a while before writing them (lest my .img files were unreadable). But basically the organization is that each bitplane is written out explicitly in turn (with some fairly simple compression).
Steve J.

1120. Upgrading to TOS 1.4 (long)

Newsgroup: comp.sys.atari.st
Date: 1989-09-27 03:31:39 UTC
From: src@cs.odu.edu
Message-ID: <10035@xanth.cs.odu.edu>
Source record: 248742

Hi! I just got done upgrading a 2-chip ROM Mega 2 ST to TOS 1.4 using a six-chip PROM set from Atari. The source of this upgrade was Lyco in Woodbridge, Virginia. If you are interested in upgrading from a two-chip ROM set to a six chip set, here's how I did it.

I'd better add a disclaimer at this point. The following is merely a description of something I did to my computer. How you use this information is up to you.

With that said...

First, I removed the motherboard from my Mega. I also removed the floppy drive and the power supply -- it makes the board much easier to handle. I was careful to observe static electricity minimization, since some of these chips contain MOSFET devices.

I noticed that my Mega had no sockets for the four ROM chips that had not been installed; not only that, but the holes were all soldered closed! The first thing I had to do was use a solder-sucker and some desoldering braid to carefully open the closed holes for U3, U4, U6, and U7. It took great care not to scratch the ultra-fine traces that run around and between the solder pads.

Next, I installed the sockets. I inspected each solder joint with a magnifying glass to look for solder bridges and cold solder joints at each pad.

It was then time to move the two jumpers marked 'w2' and 'w3' on the motherboard. At the front of the Mega's motherboard, right next to the MMU chip, there are two small jumpers that look exactly like resistors (or at least they did in my Mega). They are marked with a single black band -- perhaps to signify zero ohms? Whatever the case, they are labeled with small white boxes on the board's silk print, with holes 1 and 3 marked on each. The jumpers were installed in holes 2 and 3 in both cases. These two jumpers had to be desoldered and moved to holes 1 and 2. If I'd been careful, I could have just desoldered the wire in hole 3 and moved it to hole 1... Now that I think about it.

Another jumper, which was not already present, had to be installed in a nearby box labeled 'w4'. This box is clearly marked on the motherboard inbetween U12 and U24. I used a lead clipped from a spare resistor, about 1" long for this; any fine bit of wire would have done. It was stiff and so did not need to be insulated from surrounding metal.

I saved the most difficult part for last. The final step was to remove an integrated circuit entirely from the Mega's motherboard. This chip is labeled U12, and its only purpose is to take the ROM signals that would normally activate six separate chips, and funnel them (through the use of a three-input AND gate) into the two-chip ROM set. Since I needed to use all six ROM chips,

this IC had to be removed. It was difficult for me because the desoldering braid did not remove all of the solder, and my solder-sucker couldn't vacuum enough of it out. It took some severe wheedling to finally get this guy loose.

Of course, I had to remove the existing pair of ROMs and put the new chips into the proper sockets. This took a bit of doing in itself, since the ROMs are labeled with the proper numbers for the 520 and 1040 STs, but _not_ for the Mega ST. I had to match up the chip designations instead. This is the table I came up with:

520 ST Designation Mega ST

U2 Hi-2 U3
U5 Lo-2 U4

U3 Hi-1 U6
U6 Lo-1 U7

U4 Hi-0 U9
U7 Lo-0 U10

After plugging the ROMs -- which are actually EPROMs with labels stuck over their glass lenses -- into my Mega, I plugged 'er in and booted. The system works perfectly, or as close as TOS 1.4 gets (pretty close)! I am using it and TEMPUS II to write this file, and will be using it to upload it as well. The improvement in FAT searching is worth the price, by itself! Other features have also proven handy, including the keyboard cold-start.

Wether you have TOS 1.4 professionally istalled or choose to do it yourself, I can heartily recommend the upgrade.

1121. Free RAM in Specific Mega 2 STs !!!!

Newsgroup: comp.sys.atari.st
Date: 1989-09-27 03:38:02 UTC
From: src@cs.odu.edu
Message-ID: <10036@xanth.cs.odu.edu>
Source record: 248743

I don't know how much use to the Mega 2 owning public this will be, but it was simply miraculous for me. Apparently, a certain number of Mega 2 STs exist that have ALL 32 1 Meg DRAMs installed. I KID YOU NOT! I have, put simply, upgraded my Mega 2 ST to Four MegaBytes of RAM...

SIMPLY BY SOLDERING ONE PIN OF AN IC TO THE MOTHERBOARD.

I don't think _most_ Mega 2 STs have the extra RAM chips, since I have looked inside a couple of Mega 2s and seen the blank spaces for the RAM chips on the motherboard. This was what I thought I would find under the hood of my own, until I opened it to install TOS 1.4. I was shocked, to put it figuratively!

My Mega 2 is slightly unusual. It was sent to the retailer in a Mega 2 box, with a Mega 2 sticker on the bottom. It had two megs of addressable RAM... but a Mega ST4 label on the front of the computer. I thought this was strange, but didn't argue about it since I intended to expand it, eventually, in any case.

But as I said, when I opened it and started counting RAM chips, I found all four banks of eight chips installed, with no room left over!

How, then, did Atari get it to act like a Mega 2? All of my RAM measuring utilities had agreed that this was a two meg machine! I began intensively searching for the reason. It wasn't _too_ hard to find, either!

The Mega 4 uses an IC, labeled U59, to process the MMU signals for the upper two banks of RAM (U60 through U75). Pin eleven (11) on this IC is RAS2*, the Row Address Strobe line coming from the MMU. This pin, of all those on the entire Mega motherboard, was unsoldered! Without this signal the upper two banks of RAM are invisible to the MMU. I soldered this pin to the motherboard, and WHAM! Instant upgrade to Four MegaBytes!!

I Have Seen Santa Claus, And His Name Is Tramiel!

THANKS!!!

1122. TOS 1.4 on disk (revisited)

Newsgroup: comp.sys.atari.st
Date: 1989-09-27 04:15:53 UTC
From: cmm1@CUNIXA.CC.COLUMBIA.EDU
Message-ID: <CMM.0.88.622872953.cmm1@cunixa.cc.columbia.edu>
Source record: 248744

Actually, wouldn't it make more sense to have the OS on disk anyway?
That way we wouldn't be held hostage to the painfully slow upgrade
process of getting upgraded ROMs. Although I think the guys working on
the ROMs are doing a fantastic job and I love the new version of TOS,
it is irritating to have to wait years for a fix for many of the well
documented and annoying bugs in TOS. What in the world is wrong with
following the path of Microsoft and upgrading the OS software and
releasing new versions on a somewhat more timely basis on disk? I would
rather wait an extra 10 seconds for my computer to boot than have to wait 2+
years for bug fixes AND have to disassemble my machine to have the
fixes installed "by an authorized dealer." It seems as if the ST's
worst enemy is the company that produces it. Sorry if this seems a bit
harsh, but I waited...and waited...and waited...and bought an Apple
when I couldn't get any satisfaction. I love my little ST, but it seems
as if Atari would rather have me playing Asteroids on my machine rather
than writing or using meaningful software that could benefit us all.
What a shame.

Chris

George Woodside,

Thanks! :-) Thanks! :-) and THANKS! :-)

With the aid of your viruskiller, I detected and destroyed that pesky
little mouse inversion virus on my diskettes. Hehe, and all the time I
thought I'd broken my ROMS when I'd fiddled with the code. Whew!
I cannot thank you enough and I heartily recommend your program to the
world. It WORKS! Try it! Who knows what little nasties are hiding on
your boot sector?

1126. Re: Atari PC Portfolio is In

Newsgroup: comp.sys.atari.st
Date: 1989-09-27 13:02:25 UTC
From: wolf@cbnewsh.ATT.COM
Message-ID: <4239@cbnewsh.ATT.COM>
Source record: 248748

Two questions that I am a little unclear about:
1. Can you use rechargable batteries with the Portfolio?
(Someone in a previous article suggested that you couldn't.)

2. Do the "memory-cards" (32K, 64K, 128K) refer to actual memory
upgrades or do they refer to secondary storage? Previous
postings suggest the latter, but if that's the case, how does
one upgrade to 640K (which, I believe, was also mentioned as
a possibility in a previous posting.)

If these questions seem naive, it is for a good reason :-)

Thanks for any info,

Tom

Curious -- this includes all ST users except those in the Americas
outside the US, and Africans. Why are Canadians and Latin Americans excluded?
What about Africa? Is that what "AtariElite" signifies?

The E. Arthur Brown Company sells a cartridge port adapter.

It interfaces the cartridge port to a standard 44 pin .156 spaced
edge conector. I'm not sure if any docs for i/o to the port are
provided. It's only $14.95.

Another alternative is STonehenge. It is a ramdisk kit that connects to the DMA (hard disk) port. It allows 2 meg of 256 x 1 dynamic ram chips in banks of 8. I built one several months ago and have had very little trouble. It is available from:

Contact: Ron Schreiner (312) 520-8003
RONSAT Technologies Inc.
368 Lexington Drive.
Buffalo Grove, IL. 60089

The STonehenge kit priced at $169.95 includes;

a. STonehenge ASIC,
b. Double sided PCB,
c. 20MHZ crystal,
d. DB-19 connector,
e. Documentation,
f. Software,
g. PGA socket for the ASIC.

The Documentation and Software can be ordered separately for $10.00 (refundable with future purchase).

The builder of the kit must provide the DRAMs, a 5V 2A power supply, and a few miscellaneous components that are readily available from electronic suppliers.

Additional support kits that provide all the components are also available.

For more information or to order contact RONSAT Technologies Inc. Voice: (312) 520-8003 Modem: (312) 520-7812 Orders placed by modem receive a 5% discount. Dial-in (312) 520-7812, hit carriage return <return or enter> until "Login: " is the prompt, then enter "info"<return>.

I have a software patch if you do get it. There was a small bug in the software.

1130. Panarthea archive address note

Newsgroup: comp.sys.atari.st
Date: 1989-09-27 14:48:13 UTC
From: koreth@panarthea.ebay.sun.com
Message-ID: <34377@grapevine.uucp>
Source record: 248652

Mail exchanger records for panarthea have been installed, so you can now
mail to archive-server@panarthea.ebay.sun.com to get to the archive server.
The old address will still work as well.

(Remember to give the server a "path" command if you're on a uucp-only
site. You can usually use uunet.uu.net!yoursite!yourname if you're
not sure how to get back to your machine from here.)

While I'm posting here, I should mention that the binaries queue is quite
full and moving along nicely, though I reduced the flow to five articles
a day after a couple of complaints. Here's a preview of what's coming up
after stedt is done.

bibtex - Bibliography package for ST TeX
bootedit - AUTO-folder reordering and lots more
macfonts - Macintoshy fonts for GDOS
miniinfo - Documentation for MiniTerm
sttetris - Two more versions of the game you all know and hate
tetris2

This message is a figment of your imagination. Any opinions are yours.

This works for Spectre v1.9 and MS Word v3.01; I've never tried any other
combination.

Make a startup disk with System 3.2/Finder 5.3, LaserWriter and Laser Prep
from the MS Word Program disk. DON'T put anything else on this disk.
Use it to boot into Mac mode. Activate the Chooser DA and turn Appletalk on.

Your machine is now hung.

Or is it?

Wait about 5 minutes or so. The machine WILL eventually come back, in
good enough condition to close the Chooser and force an eject by repeatedly
hitting <f1> and popping the disk in and out until the Finder is satisfied.

Reboot with this same system disk. Appletalk is now on and you can
successfully Choose and use the LaserWriter to do your Postscript dump.

>PC. Is this correct? I'd like Avant Garde's comment on this.

Strange - as it is the original pcditto emulates a PC with 703k
memory free - which is (my guess) different depending on how much memory
is on-board on an st. I can't imagine new restrictions being imposed on
the new version which weren't imposed on the original...

Now what I would like to know is, I am just about to get tos 1.4 installed
on my 1040st. Will that make it incompatible?

I have my supra 30mb hard disk set up to autoboot and in the manual it
says that if you want to boot directly from floppy you must turn off the
computer, hold the ctrl-shift-alt keys, and turn it on. Wait for theprogram
to start loading, and then you can let the keys go.

You MUST turn off the computer though - pressing reset will not work.

I didn't say it was hard, I said it was nontrivial.

But the whole point is you DON'T have a telephone extension cord! You
can't use a Mega keyboard cable as a phone cord, because the wires are
all swapped around.

(As it turns out, it DOES work, a little: I just tried using a phone
with a Mega keyboard cable, and I got a dial tone. However, I couldn't
dial using a Touch-Tone (tm) phone. I expect a rotary phone would
work. I didn't test to see if the phone would ring.)

Speaking of memory expansion, I have the instructions to upgrade a 1040 ST to 2.5 megs without an expansion board if anyone wants them. It's nice not having to worry about cables or fitting things.

-Tim

1140. Problems w/ Mega Clock

Newsgroup: comp.sys.atari.st
Date: 1989-09-27 19:30:57 UTC
From: mjv@iris.brown.edu
Message-ID: <16450@brunix.UUCP>
Source record: 248662

Hello. I'm new to the Net and am very glad to now have access to some decent information about the events in Atariland.

I have a strange problem with my clock on my Mega2. After setting the clock and then rebooting, the ST comes back with a date of 0/00/00 and 12:00 time. I've switched the batteries twice (I now they are good since I checked them on my walkman.) I've opened up the computer to check the cabling and that seems fine. I am using a control panel that came on an earlier Mega ST language disk but I don't think that that's the problem. BTW, the clock works fine until rebooting. If anybody has any suggestions, I sure could use them.

A TOS 1.4 note: I called the two dealers nearest me and neither of them have the wonderful new rainbow baby and both said it wasn't out yet. However, since reading the Net I know that isn't true. This is probably one of the benefits of living in New England, the land that Atari hates. (My favorite dealer closed down and he was over an hours drive away.)

Thanks.

From: andyc@hplsla.HP.COM
Message-ID: <5440057@hplsla.HP.COM>
Source record: 248664

With regard to my posting about defragging, here's a caution! IF you are defragging the boot partition, BE SURE to re-write the boot sector of that partition after defragging the partition. (With ICD host adaptors, use the BOOT & CONFIGURE options of HDUTILS.PRG). The process I outlined zeroes the boot sector, so you'll lose your autoboot from hard drive. (Fortunately, recovery is easy, just boot from floppy as you would after formatting the hard drive, and then reconfigure the hard drive for autoboot).

I was just reading an article in the Sept 25th issue of EE Times on the TT. This is part of what it says:

"The accompanying microfloppy drive lets the machines read and write data in IBM PC, Macintoch and Atari disk formats...

All three (machine models) pack 512 kbytes of system ROM-sufficent to bundle most of the Atari operating system software in silicon with enough space left over for Macintosh emulation when Mac Toolbox ROMs are dropped into the motherboard."

Is this true? It also said that they would be avaible in Europe this fall but not expected in the US before winter.

Hi,
My request is even simpler. I would like to see the TT in the
metropolitan N.Y. area any time soon. When I bought my ST almost three
years ago I was told that the TT would be out in less than six months.

I would like to get one but how long must I wait ??

It would be really great if someone at Atari could give us some
information about this (even an approximate release date would be
appreciated).

Any info will be appreciated.
Thanks,
John

>last weekend, my dj stopped printing. I put in a brand new cartreidge
>that had an expiration date of 12/90 and it printed about 10 pages
>and then died.

I don't see how this could have anything to do with refilling the
cartridge. I mean, the whole print head IS the cartridge. If you
replace the cartridge, you'd have to invoke homeopathic magic to
blame it on the previous cartridge!

To the guy that claimed that your HP repair guy would be able to tell
the difference between HP clogged ink and so-called "bogus" clogged
ink -- NONSENSE! Do your really believe that the HP repair guy is
going to send out samples of your clogged ink to a chemical analysis
to determine if he should void the waranty or not? Nobody has that
amount of luxury time available.

When I had my HP DeskJet Plus taken apart to pieces (a very easy
task, by the way) I saw the little plastic tube that runs the primed
ink down to a blotter pad in the base of the unit. It certainly
wouldn't take a rocket scientist to figure out how to clean the
tube out if it did become clogged! (The fact that HP ink is
air drying and so is "bogus" ink, leads me to seriously doubt that
one is more likely to clog than the other.)

The type of person who refills ink cartridges is almost suredly the
same type of person who will take the skins off the DJ+ to clean
his own plastic tube. Let HP make is ripoff money off the types
who don't know which end of a soldering iron to hold. I'll gladly
continue to (start to) refill my cartridge without fear of HP
detection or loss of waranty.

Unless Atari is inane, lay all comments about the availablility of Porfolio to rest. Today in the New York Times (and many other major papers I'm told) were FULL page ads in the Business sections showing the Portfolio and announcing Federal Express shipping and a 'if you don't like it in a month, send it back for a full refund' policy.

Looks like Portfolio is here guys (and women.)

Well, I have a MUCH easier way to remove soldered-in chips. (As long as you
don't plan to re-use them.)

Go out and buy a pair of diagional cutters, with a fine (small) tip.
(micro-sized) When the chip is sitting in the board, cut each of the leads
where they go into the silicon. Then, just pick out the "body" of the chip.
Then, get a pair of small needle nose pliers (or I usually use tweezers) and
pull each lead out one at a time as you touch the pad with a hot soldering
iron. Then, use solder wick to clean out the holes. I have yet to destroy a
printed circut run using this procedure. You might want to practice once or
twice on a junk circut board.

Of course, if you decide to accept this way of removing IC's, you're on your
own. I won't charge you a dime, nor will I accept any responsibility if you
melt-down your ST.

If you've got questions about this, drop me a note.

Dave Small was supposed to be on a GEnie confernce this week, but was sick and couldn't make it. It seems that Dave And Sandy have a couple of children who are starting school. Dave has a funny way of saying it. He said something like the kids got sick and 'it was like a diease swap-meet'!! I can't quote Dave exactly, but he mentioned it on his GEnie Roundtable.

So, maybe when Dave and his family get better they can answer the phones again!!

P.S. Gadgets reports on GEnie that they are shipping the GCRs to preorders. It looks good for the GCR.

|---
| * Via ProDoor 3.1aR

I think your confusing chip quality with throughput. Swapping the CPU or SIO will provide no inprovement in throughput (It will probably make the unit 1% more relieable though.

The "65AB V.062485 U4 24K 003096 RDV 2.21" is probably the central core of the modem electronics. Your best bet, is to find out who the manufacture of that chip is, and get the databook for that part from them. They may have a compatible part with higher transfer speed.

Actually your best bet for higher speed, is to get a new modem. BTW 2400bps is nothing to sneeze at. I myself have only a 1200bps modem.

> as possible. I need it to go through about 10,000 items, each with a
> size of ~ 10 bytes. Does anyone have something like this already coded?

Direct from the dLibs library source archive... here is bsearch()...

----------------------------------8<----------------------------------
#include <stdio.h>

int _bsearch; /* index of element found, or where to insert */

char *bsearch(key, base, num, size, cmp)
register char *key; /* item to search for */
register char *base; /* base address */
int num; /* number of elements */
register int size; /* element size in bytes */
register int (*cmp)(); /* comparison function */
{
register int a, b, c, dir;

a = 0;
b = num - 1;
while(a <= b)
{
c = (a + b) >> 1; /* == ((a + b) / 2) */
if (dir = (*cmp)((base + (c * size)), key))
{
if (dir > 0)
b = c - 1;
else /* (dir < 0) */
a = c + 1;
}
else
{
_bsearch = c;
return(base + (c * size));
}
}
_bsearch = b;
return(NULL);
}
----------------------------------8<----------------------------------
```

You will probably want to hard code the comparison function, since I
assume this is a special purpose "as fast as possible" application of
the more general function. Also, obviously, conversion to hand-optimized
68000 assembly is left as an exercise to the reader.

> The most helpful response gets a postcard with an incredibly ugly
> picture of Hill Center, the mathematical and computer sciences
> building here.

Actually, I'd prefer if you just sent me back your optimized assembly
code conversion. That way I can re-generalize it (to take a compare
function pointer) and include it in the next dLibs release.

1161. Bugged ST with alternative graphics

Newsgroup: comp.sys.atari.st
Date: 1989-09-28 17:02:23 UTC
From: i8k9d302@vax87.auc.dk
Message-ID: <169@vax87.auc.dk>
Source record: 248683

Hello there,

I have a problem with my ST and I hope somebody out there can help. My setup is a 1MB 520 STFM with a 20MB SH204 harddisk (the bulky noisy one) and a mono monitor. The problem is that every once in a while when I write to the harddisk (and only when I write), the screen tilts, ie it looses the horisontal sync and becomes utterly unreadably. I tried to hook my harddisk to a friends ST; it worked like a charm. I tried to hook a different monitor (colour monitor) to my ST; same problem. So I figure the problem must be with the ST.

The funny thing about this problem is that it is periodic in a funny fashion, ie. one week it may be write to sector n that provokes the tilt, but the next sector n is fine, and sector m is acting up. Weird indeed.

I spoke to Atari Denmark about the problem and they said "Oh yeah, we know that one, call this company, they do all our repairs". I phoned the company and got the chief engineer told me he had never heard of it and neither had anyone else I spoke to.

I am not too happy about sending the machine for repair with a problem like this, because I can imagine only too well getting it back after having paid 100 dollars for repairs, adjustment, cleaning, polishing etc. just to find the problem isn't fixed at all because it seemed to work OK the 5 minutes the had it hooked up. Not to mention the inconvinience of having to ship ST and harddisk (no local ST repair shop) and getting a load of spares back a fortnight later.

Has anyone ever heard of a problem like this ? Any help is appreciated.

Tales of an excursion down the path of darkness.....

For the last few weeks, I've been trying to find a MIDI package for a 520ST. Shouldn't be too hard, right? Well, after a couple of hours in fron of the phone book, I broke down and called atari and asked them who sold atari software near where I live. THey told me of only two stores. One was about 45 minutes away and the other about 20 minutes away. Not too bad if I live in your average town. HOWEVER, I LIVE ABOUT 15 MINUTES FROM ATARI'S HQ!!! Why are there only two stores in Santa Clara county that carry atari software? But wait, it gets much worse than this.

I went to this store B&C Computer in santa clara, to check out MIDI stuff. THey had several packages to choose from. So I asked the lady there if I could take a look at them.

"No, we can't open the packages. We'd have to sell the software as used."

Now, I'm thinking to myself, oh great, we've got a genius here. "How do you expect to sell this stuff if I can't look at it? Do you know anything about these?"

"No."

<Deliberate pause...By this point, I'm just dying to see how she extends this line of reason.>
"We're not salesmen We have the stuff if someone wants it."

<gasp> "Oh. You probably don't sell a lot of software."

<dead air>

-=-=-

As I'm walking out the door, a man behind the counter starts to tell me how the software business works. He says, "In this market, you have to buy a package and try it out. If it works for you, that's great. If it doesn't, buy another."

Now, I'm really getting perterbed. "Look, I don't plan on buying every package in existence, or even more than one. I just want a look at the stuff before I buy it."

This is a good one here...."Well, maybe you aren't ready to spend the money to buy something then."

"Well, maybe you aren't ready to own your own store."

-=-=-=-=-

Atari, if you're listening, maybe you should have a little talk with your software/hardware distributors. All two of them. They could use some pointers in the customer relations/sales development areas.

Between the difficulties of finding a store in the first place and then the escapade I went through once I did, I have to wonder why people would want to buy an ST when they can buy a MAC and get software on every street corner.

HEY ATARI!!!! Get your distribution outlets in line. At least make them pass some sort of test. Ask them to tie their shoes and say their names at the same time.
-=-=-=-=

If any of you could recommend a decent MIDI package, I would really appreciate it. Obviously, the store wasn't a lot of help. I saw a few packages there, ranging from $54 to $200. I don't mind spending the money, if it's good stuff. Full editing capabilities, as well as scoring. Please, oh please, help me out.

<deep breath>

1164. ST systems fonts & nethack

Newsgroup: comp.sys.atari.st
Date: 1989-09-28 17:23:02 UTC
From: paul@cacilj.UUCP
Message-ID: <1242@cacilj.UUCP>
Source record: 248686

I recently got nethack 3.0 for the ST. It looks like a good implementation, only I am dissapointed by the ST system font's line drawing capability (actaully, the lack thereof :-). I have a desk accessory that changes the system font to other fonts, but there is no source, nor is there any hint of *how* to actually do this!

I would like to have a program, or better yet, source for a routine, to change individual characters in the character set. You see, I like nethack with nice "boxy" rooms, and one could certainly come up with some nice characters for webs, chests, stairs, etc. if only you could change the character set!

Of course, if it is only possible to completely swap out the built-in font, and swap in a new one, you could always copy the alphanumeric characters from the system font, and then design new ones for nethack.

I have MWC (and gcc) and a font editor, all I need is some info! Any pointers would be appreciated!

Thanks,

My mailer had problems earlier so this is a repost:

FOR SALE!!!

Atari 520ST Computer System
1 MEG memory (expanded by EZ-RAM II, expandable to 2.5 megs)
3 1/2" single sided disk drive
Z-time clock chip
mouse, 2 joysticks

Atari SF314 3 1/2" double sided disk drive
Supra 20 meg Hard Drive
Atari SM124 Monochrome Monitor
Atari Sm1224 RGB/Color Monitor
Monitor Master
Avatex 1200 baud modem

BASIC
Mark Williams C Compiler V 2.1.7
Dr. T's MIDI Recording Studio & MIDI cables
Test Drive (game)
Ultima IV (game)
Falcon F-15 (game)
Dungeon Master (game)
The Pawn (game)
Winter Games (game)
Championship Wrestling (game)
MicroLeague Baseball V II (game)
1987 MLB Team Disk
Gridiron Football (game)
Leaderboard Golf (game)
Ballyhoo (game)
Gauntlet (game)

Programmers Guide to GEM (book)
Atari ST application programming (book)

The above equipment cost me over $2500 new and I'de like to sell it as a unit for $1500. If I can't sell it as a unit then I'de like to sell as much as possible. I can be reach by email at ambi@bu-it.bu.edu or by phone (617) 353-2780 (day) (617) 787-2629 (night).

In article <45da3096.14a1f@force.UUCP> covertr@force.UUCP (Richard E. Covert) writes:
>I would like to know how Atari can produce and sell a Laptop ST for under
>$2,000 while Apple charges almost $5500 for basically the same machine??

Possibly because Apple produced a real machine for which there will be an upgrade path, support, expandability, etc? Dunno; I haven't seen either. Apple's laptop IS pricey, but perhaps not outlandishly so. The market will decide.

>The only real hardware difference between the two machines has to be the LCD
>display??

Since when has hardware been the only important factor? TOS is junk. GEM is near-junk in its present buggy ST incarnation. No, that's not fair I guess; TOS & GEM are "priced almost appropriately" -- howzzat? You should pick your hardware based largely on what it will run that you wish to run. Why else would bazillions of people still choose to buy XT/AT-clones (price aside :) ?

>Geez, if there is that big of a market for a Laptop Mac , then a LapTop
>ST, with the Gadgets By Small (which is now shipping according to the
>latest news on GEnie!!!) GCR mac Emulator should sell by the thousands!!

I don't follow that logic. As someone else here has already remarked, "emulation" does not a clone make. I bought a Magic Sac for my 520ST because it was a neat hack & fun toy. But depend on it? Pfah! You'll have to tack a few 9's after "99.%" compatible before businesses will buy it. And I doubt the consumer market (i.e.: us) will ever eat more than the first one or 2 of your "thousands" of GCRs, let alone Staceys.

>I have seen pictures of the Laptop ST and seen actual Laptop Macs on
>TV, and the Laptop ST is much smaller and lighter then the Laptop Mac.
>So, let's just hope that Atari can get the Laptop ST out before Apple
>eats the market.

IBM/NEC/Zenith and Apple >>> OWN <<< the portable market in this country. It's already been eaten. Atari may get a few crumbs in the USA, if they pursue them. [I find it helps to think of Atari as a European company that builds for Europe, sells in Europe, and just coincidentally happens to live in the U.S.]

>Ken B, or John Townsend, if you read this message PLEASE PLEASE ask Jack
>Tramiel to advertise the Laptop ST in the WALL STREET JOURNAL like Atari
>has done for the Atari PORTFOLIO!! And mention the GBS GCR cartidge, and
>Atari could clean up with the Laptop ST!!!
>
>Well, its startinf to look good, if only Atari can get the Laptop ST and the

>TT out this year!!! I have told my local dealer that I want one!!!

My my, SO many exclamation-marks! :) Forget "cold fusion"; if we could
only bottle "Atari-owner loyalty" there wouldn't BE an energy crisis. :)
(So speaks an ex-Atari-enthusiast.)

>laser printers anyway.

But you've just lent weight to the opposing side, Richard. David Small is a warlock-class hacker. But the GCR is not a Mac. It is neat. It is cheap. It lets an ST owner glimpse much of the Mac world. But it won't be a serious Mac alternative.

Look, someone who wanted to run Macintosh software, who didn't already own a Mac or ST, who didn't have Big Dollars to spend but could afford a GCR+Stacey, will (I'll bet my last floppy disk) 9 times out of 10 buy a Mac Plus instead. I know I would, if that criteria matched my situation. Someone who wants & can afford a >>portable<< Mac will BUY a portable Mac. Only those want a portable Mac AND to whom every penny truly matters AND who perhaps are not completely informed or like living on the edge MAY go for Atari's "solution".

The backlash of frustrated would-be Mac-users with their not-quite-Macs aka Staceys w/ GCRs would probably crisp what little U.S. presence Atari still has, anyway.

>I think that the STacy/GCR combination will be a big seller!!! At 1/3 the
>price of a real Laptop Mac, it will cleanup!!!

Cleanup WHAT for Pete's sake? Atari's act? Gee, I know I'm coming across like a personal attack on you, your love for Atari, etc. Sorry, I don't mean to. I just word-associate "doubt" when I hear "Atari" these days.

(I know: you're a Cubs fan too, right? Oops, just kidding! :)

Date: 1989-09-28 19:00:48 UTC
From: chuck@richsun.UUCP
Message-ID: <452@richsun.UUCP>
Source record: 248693

Hello,

I am looking for actual C code to use sounds created with an audio digitizer. I own ST Replay4 and Mark Williams C. Replay4 comes with assembly routines but I have not yet been able to use these alone or with 'C'. I also own G.I.S.T. and was able to use it with my C code and Mark Williams C for sound effects. However, I would like to use sampled sound in my C programs. Also, I've read about a new audio digitizer product, which apparently is in beta right now, called Pro Sound Gold by a British company which will support the C language.

Any help would be greatly appreciated.

Source record: 248694

Today's USA Today has the full-page Portfolio ad on 11A:

Actual Size
(picture of Portfolio)
Actual Price
$399.95

It goes on to describe the system, the RAM cards ($79.95 for 32K) and other accessories, including the $49.95 parallel and $79.95 serial interfaces that aren't available until October. There's a 30-day free trial. The toll-free (USA, I presume) number is (800) 443-8020. They'll charge your credit card for the merchandise plus $8.50 for shipping (Federal Express).

Judging from the "Actual Size" photograph, this definitely is a machine for two-fingered typing. The keyboard makes the Trash-80 look generous.

1173. 1040 ST Ram Upgrade, $9.50 per chip

Newsgroup: comp.sys.atari.st
Date: 1989-09-28 21:40:36 UTC
From: brazil@pawl.rpi.edu
Message-ID: <1989Sep28.214036.4702@rpi.edu>
Source record: 248695

What follows are the instructions to upgrade a 1040ST by replacing chips, therefore eliminating the need for an expansion board.

I also have a suggestion: If a bunch of us get together an buy DRAM in volume they could be very cheap. Chip Merchants has 100ns 1 Mbit DRAMs for $9.35 each, and they have volume discounts for 100 and 500 parts. If six of us get together, considering it takes 16 chips for the 2.5 meg upgrade, we could get the 100 volume discount. Anyone interested?

> going out first. New orders are backlogged until November.
>
> Peter Szymonik
> Xorg@cup.portal.com

I try to write a simple little note saying that I read on GEnie that the GCR is
being shipped and I get flamed!! I did NOT say that the GCR was Vaporware.

But, lets be fair about this. GCR was delayed, as you admit yourself. If it was
a product of Atari, and not Gadgets By Small, wouldn't you classify it as
VaporWare?? That's because Atari has promised many products (Vaporware) which
have NEVER been marketed. But, GBS has produced every product that they have
announced, hence it wouldn't be expected for the GCR to be Vaporware, even though
it was months late. In fact, I was *TRYING*, in my own clumsy way, to help
publicize the availablity of the GCR. Not all USENET readers have GEnie accounts.
And GBS has an active GEnie RoundTable were the latest news can be read.

So, calm down a little. I didn't mean to criticize GBS and/or the GCR.
Boy, some people just have to jump all over me because of even an implied
criticism of Dave Small.

!!!!!!!!!!!!! DON'T READ THE REST WARNING BAD THINGS SAID ABOUT GBS & OTHERS !!!!

And I don't even want to get into the Spectre support of the SLM804. Please
don't even mention SLM804 and Spectre 128 in the same article. That is one subject that
is guaranteed to start a war!! Dave Small has provide a limited (144 dpi) printer
driver for the SLM804, and has indicated that Spectre will not go 300 dpi. If you
want better printouts with a SLM804 then you need to buy the $500 UltraScript
package, and have a LARGE hard disk drive with 3 types of partitions. One native
ST partition, one Mac HFS partition and one Mac MFS partition. And have plenty of
time to transfer the PostScript files from Mac MFS and/or HFS partitions to native
ST partitions, and thence to UltraScript. That is a very clumsy way to get 300 dpu
print outs!! It would be much nicer to get 300 dpi directly from inside Spectre. Then,
I wouldn't have to spend $500 for UltraScript just to get a decent printout of a
Mac drawing!! But, if you want 300 dpi printouts on the SLM804 that is your only
alternative. Correct me if I am wrong, but that is my understanding of Spectre
support of the SLM804 laser printer.

By the way, GBS isn't the only emulator to have troubles printing on the SLM804. Never pc speed and pc ditto II will print out on the SLM804. And both have promised SLM804 in the Next Release. sounds like GBS last year!! But this time I am not buying the emulator until I see the SLM804 printing under it!! I refuse to go through another year like the last one waiting for the promised support, and then being disappointed with each release. I bought my Spectre 128 in Sep 1988 and to this day I still can't print out at 300 dpi w/o being force to use UltraScript. So, pc speed and pc ditto II will not be sold to me until I see a working SLM804 printer driver!!

On a side note, GBS being small doesn't excise them from not making schedules. I remember last year when Publishing Partner was released. Softlogic was also a very small company when they announced the PP upgrade called Page Stream. When PgS was a year late, being small didn't stop people from flaming Softlogik. Customers expect vendors to release a product when announced, and don't care about excuses like 'We are too small'. So, Softlogik was deservedly flamed. Softlogik would have been better off if they hadn't announced PgS until it was ready to ship. Even though that would have meant some lose of sales, it would have built a better reputation for the company. Avant-Garde is an example of a responsible company. A-G wanted like mad to release pc ditto II as soon as possible, but they didn't send out the upgrade coupons UNTIL pc ditto II was ready to ship. So, even though pc ditto II was months late, A-G didn't have a bunch of customers with $$ yelling at them. A-G didn't start accepting the upgrade coupons, with the $$, until A-G had pc ditto II. Softlogik, on the other hand, accepted upgrade $$ for PgS as much as a year before they shipped PgS.

!!!!!!!!!!!!!!!! END OF FLAMES !!!!!!!!!!!!!!!!!!!!!!!!!!!
P. S. Pete, I have given you all kinds of words in this message to twist into whatever kind of warped meaning that you want to make. I mean, if you could take one word (Vaporware) and twist it, then you should have a field day with this message!!

Richard (Enjoy yourself Pete) Covert

1175. 1040 ST Upgrade(long)

Newsgroup: comp.sys.atari.st
Date: 1989-09-28 21:56:33 UTC

A 2.5 Meg Socketed Ram Upgrade for the 1040ST

Copyright 1989
Barry Orlando

A Shareware File by Barry Orlando Dated: May 20, 1989

Introduction

This shareware text file provides a procedure which details a 2.5 megabyte on board RAM upgrade project. The method described replaces 16 256K dynamic RAM chips with 16 one megabit dynamic RAM chips installed in chip sockets. Reinstallation of the ST's metal shield cover is also not impaired.

The beauty of this modification is that pin compatibility is simplified by the use of sockets instead of directly soldering the 1 meg RAM chips (DRAMs) to the motherboard and by the fact that the removed bank of sixteen perfectly reusable 256K DRAMs can be resold by you to persons upgrading 520STfm computers to 1 megabyte.

If you use this upgrade method, I recommend that you also use the same high quality low contact resistance sockets that I used and have listed below, than to use any other standard sockets. These are the type and quality which are used on expansion boards made for the IBM clones.

I originally wrote this procedure to aid me in upgrading my own 1040ST's memory to 2.5 megabytes because I didn't trust myself not making mistakes and possibly damaging any of the electronic components, especially the new DRAMs which I didn't consider cheap. I might note that my 1040ST's pc-board was marked Rev 4, but I don't believe that any other recent board revisions (if they exist) for boards with 32 256K DRAMs installed should affect this procedure.

Disclaimer of Liability

I make no claim that this modification will work for you. I can only say that it worked for me. This modification should not be attempted by anyone except by someone with experience repairing or building digital electronic circuits. Performing this modification will be done at your own risk and may void the warranty on your computer.

1

Background

The 256K dynamic ram chip differs from the 1 meg dynamic ram chip by having one additional connection, namely the address input A9. The

following chip diagram illustrates this and shows pin layouts:

```
256K 1meg
------\__/------ ------\__/-----
A8|1. 16|VSS Din|1. **18|VSS
Din|2 *15|CAS WE|2 17|Dout
WE|3 14|Dout RAS|3 *16|CAS
RAS|4 *13|A6 NC|4 15|A9
A0|5* *12|A3 A0|5 *14|A8
A2|6* *11|A4 A1|6* *13|A7
A1|7* *10|A5 A2|7* *12|A6
VCC|8* * 9|A7 A3|8* *11|A5
---------------- VCC|9* *10|A4
---------------
```

Truth Table for above chips:

```
---------------------------
A0-A9 Address Inputs
CAS Column Address
Din Data In
Dout Data Out
RAS Row-Address Strobe
VCC Power (+5V)
VSS Ground
WE Read/Write Input
NC Not Connected
* pc-board pin compatible
** pc-board pin compatible on most chips
```

The 2.5 megabyte modification essentially reconnects all pins as previously connected on the lower of two banks of RAM chips plus adds a new line from the previously unused A9 pin on the ST's MMU (pin 64 of U15) to all new 1 meg chip pins A9 via a new 33 ohm resistor. Some of the Address leads are interchanged, but this has no effect on the operation of the computer.

Major Tools

1. Desoldering iron (I recommend the spring loaded type that

2

incorporates the heat source.)
2. 15W grounded soldering iron (Radio Shack 64-2051 or similar)
3. Wire wrap clip and stripping tool
4. Exacto knife
5. 3-5 power magnifying glass or jewelers eyepiece

Parts Required

1. One 33 ohm resistor, 1/4 watt, 5%.
2. 5 feet length of 30 gauge wire, Kynar wire wrap solid conductor (Radio Shack 278-502).

3. 16 double contact low profile dual-in-line I.C. sockets (D.C. Electronics catalog no. T02-18, cost: $0.12 each)
4. Pack of 10 "Socket Wrap ID" (D.C. Electronics catalog no. 16-ID, cost: $2.05) You can get in touch with D.C. Electronics at the following location:

D.C. Electronics
P.O. Box 3203
Scottsdale, AZ 85257
(800) 423-0070

5. 16 one megabit dynamic RAM chips, 120ns (I used Hitachi Part no. HM511000-12, and paid $24.00 each plus state tax and $4.00 shipping from Ed at Computronix on Dec 16, 1988). You can get in touch with Ed at the following location:

Computronix
2151 A O'Toole Ave.
San Jose, CA 95131
(408) 943-0771

Work Area

Prepare your work area by placing a towel on your flat working surface and cover it with a layer of aluminum wrapping foil. This provides padding for the components and a conductor for static electricity.

Precautions

Since the slightest static discharge could easily damage components on your computers pc-board, always keep one hand on the metal foil bonded along the outer rim of the pc-board before and during touching any part of the pc-board or its components. Avoid working on

3

this project when the humidity is low.
Procedure

1. After removing the pc-board from the insides of your computer, desolder and remove the front 16 256K chips (U33 through U45 and U16 through U30).

2. Using the Exacto knife, cut the following traces on the top side of the pc-board:

a. Between U30's pin 1 and U61's pin 1.
b. Between pin 14's of U33 through U45 and U16 through U30 and other pin 14's of U46 through U61.
c. Between the thru-hole (nearest to pin 1 in center of U32) of U32 and U46's pin 1. (Note: This thru-hole traces to U32's pin 1 on the underside of the board.)

3. Using the Exacto knife, cut the following traces on the bottom side of the pc-board:

a. Between U30's pin 1 and the 33 ohm resistor R76.
b. Between U32's pins 2 and 14. Do the same for U33 through U45 and U16 through U30.
c. Between U30's pin 4 and U15's pin 8. (Note: Cut the trace after it goes through the board to the bottom side near resistor R91, but before it reappears on the top of the board via another thru-hole.
d. Between U32's pin 14 and the thru-hole located between U32 and U33.

4. Preparing New Sockets and Soldering Them Inplace

a. On all 16 new sockets, remove the internals of pin 4.
b. On all 16 new sockets, bend all pins 1 and 17 flat against their bottom then up against their outer side.
c. On 14 of the new sockets, bend pin 18's flat against their bottom and pointing straight out to the side.
d. On the remaining two, bend both pin 18's flat against their bottom but back and down so it will just reach and fit into the pc-board hole of it's adjacent pin (pin 17). These two sockets will be installed and soldered with the socket's pin 18 going into the old 256K chip's pin 16 hole below the new socket's pin 17. Trial fit these two sockets at this time.
e. Using a pair of scissors, cut pieces of "Socket Wrap-ID" plastic markers for sandwiching them between the new sockets and the pc-board during installation. These little plastic markers should be cut so as to electrically isolate the socket's pins 1 and 17 from leads and traces on the pc-board, and from pin 18 of the socket for the two separately prepared sockets above, but also so as not to interfere with seating the socket's four pads flush with the top of the pc-board upon installation.

4

f. Solder the two sockets with the bent back pin 18 and markers into U30 and U33.
g. Solder the remaining sockets with markers into U34 through U45 and U16 through U29. Pin 18 of these socket's must be soldered to the top of the board at the nearest thru-hole that the pin 18 just barely reaches. Use plenty of heat as these thru-holes are big heat sinks.

5. Mounting The New 33 Ohm Resistor

a. Install a new 33 ohm resistor on the pc-board by drilling two small holes from the top at points near capacitor C55 and resistor R70. Make sure you don't drill through a trace on the other side by holding the pc-board up to a bright light and marking the spots with a pencil.

6. Wiring

Wire the following connections on the top side of the board:

a. Between U32's new socket's pins 1 and 17 and a thru-hole on the pc-board between U32 and U33. This thru hole is the only one that has a trace that runs to another thru-hole between U46 and U47 on the top side of the board.
b. Between U16's new socket's pins 1 and 17, and pin 2 of U54. Solder the wire directly to the side of the chips pin 2.
c. Between each of the remaining new socket's pin 1 and 17 and a thru-hole in back of each 256K RAM chip (i.e., U47 through U53 and U55 through U61). These thru-holes are the ones that you will find traces back to either pin 2 or pin 14 of U47 through U61 and then trace over toward U22, U23, U26, and U27. Actually, pins 2 and 14 are tied together on the bottom of the board for every 256K RAM chip still installed. So that's 14 more wires altogether (i.e., each new RAM chip's pins 1 and 17 will be connected to the pins 2 and 14 of the 256K chip directly in back of it.

Wire the following connections on the bottom side of the board (Note: all pin numbers here refer to the pin numbers on the pc-board, not the pin numbers of the new sockets or new ram chips):

d. Between U15's pin 64 and one side of the new 33 ohm resistor.
e. Between all pin 14's of U32 through U45 and U16 through U30, and the other side of the new 33 ohm resistor.
f. Between all pin 2's of U32 through U45 and U16 through U30, and the thru-hole near R91 which had its trace cut to U30's pin 4. This thru-hole traces back on top of the pc-board under the bank of resistors and over to U15.
g. Between U61's pin 1, U30's pin 4, and the cut trace side of resistor R76.
h. Between U30's pin 1 and U61's pin 3.

5

8. Inspect all solder joints with the magnifier for solder shorts and faulty connections. Verify that all connections were made correct.

9. Install the new 1 meg RAM chips into their new sockets.

10.That's it! Clean isn't it? Now sit back and admire your work.

12.Reassemble the computer and reconnect the monitor and power cord and let it whirl!

Shareware Policy

I am distributing this documentation as a $15.00 Shareware File. Please feel free to re-post on your favorite Information Service or local BBS. I ask only that you do so in its original unaltered form.

If you have followed these instructions and everything worked for you, I'm sure you will appreciate the effort I put into documenting this project and the money it has saved you from buying one of those

expansion boards on the market or by the time you could have spent trying to figure such a project out by yourself. Please send your shareware user registration fee to:

Barry Orlando
1120 Deerfield Dr.
Napa, Ca 94558

All registered users will be sent free of charge, a utility disk and color photographic prints of the completed project. The utility disk includes a program to test the new RAM and instructions on how to further modify the computer to a full 4 megabytes. The Utility Disk contains the following support files for the socketed 2.5 meg 1040ST modification:

1. SYSTAT7.PRG - A handy public domain utility which shows some neat things going on inside of your computer. Of special interest is the size of the ram.
2. BANKSTAT.TOS - A program that displays a table of possible memory configurations which are consistent with those published in the hardware specification from Atari Corp. (Developer's Docs). The program also reads into memory and displays your computer's current memory configuration for reference.
3. BANKSTAT.C - The C source code for BANKSTAT.TOS.
4. MEMTESTR.TOS - A program that performs a dynamic test of Bank 0 (the new memory bank of 1 megabit chips installed by 25MGUPGD.DOC) for data integraty and reports any defective DRAMs including the specific IC number.
5. MEMTESTR.C - The C source code for MEMTESTR.TOS.
6. 4MGUPGD.TXT - A text file that provides instructions for

6

upgrading the 2.5 meg 1040ST to 4 megs.

The two 8x10 photographic color prints show the completed 2.5 meg modification on my 1040ST (One print for each side of the motherboard). These prints may be helpful since they show how the completed wiring should look.

Good Luck!

7

1177. Re: REFILLING HP DeskJet INK CARTRIDGES -- a warning...

Newsgroup: comp.sys.atari.st
Date: 1989-09-28 23:10:20 UTC
From: neff@hpvcfs1.HP.COM
Message-ID: <2150017@hpvcfs1.HP.COM>
Source record: 248699

O.K. I'll open my mouth a bit. A little truth can go a long way ...

>I've been refilling my hp carteidges for about 6 months now, and,
>last weekend, my dj stopped printing. I put in a brand new cartreidge
>that had an expiration date of 12/90 and it printed about 10 pages
>and then died.

and a responder says:

>>I don't see how this could have anything to do with refilling the
>>cartridge. I mean, the whole print head IS the cartridge. If you
>>replace the cartridge, you'd have to invoke homeopathic magic to
>>blame it on the previous cartridge!

...

>>When I had my HP DeskJet Plus taken apart to pieces (a very easy
>>task, by the way) I saw the little plastic tube that runs the primed
>>ink down to a blotter pad in the base of the unit. It certainly
>>wouldn't take a rocket scientist to figure out how to clean the
>>tube out if it did become clogged! (The fact that HP ink is
>>air drying and so is "bogus" ink, leads me to seriously doubt that
>>one is more likely to clog than the other.)

The person that had a pen deprime that would not recover probably is seeing one of two situations: 1) His pen deprimed due to a pen failure which has nothing to do with ink refilling. This does happen sometimes and if a new pen suddenly deprimes and priming has no effect our dealers are authorized to replace the pen. 2) His pen deprimed and normal priming would have reprimed the pen but the prime tube is clogged due to using refilled cartridges. One way to distinguish between these cases it to try to prime the suspect pen on another DeskJet and see if the pen works. If it does, the tube is probably clogged and your printer is no longer priming.

The person who mentioned it is fairly easy to clean the tube is also correct. It is also true that a clogged tube is the main reason ink refills will void the warrantee. However, YOU may be brave and smart enough to take apart your printer, risking breaking who knows what, and unclog the prime tube, but the average DeskJet user would be more likely to take his printer in for warrantee repair. It is also fairly messy to take apart and clean the service station -- I know, I've done it before, but then again, I always figured I could have been a rocket scientist if I had wanted to :-). It is also fairly easy to break some of the plastic parts if you don't know what you are doing.
Since we are pushing the DeskJet as a no mess, no fuss inkjet solution

obviously messing with ink to refill cartridges and taking apart the service station to clean it and unclog tubes runs contrary to this message. Refilling cartridges and cleaning the service station is kind of like changing your own oil in your car. Its not very hard to do, but most people would rather spend some extra money to avoid dirtying their hands.

Obviously, once your DeskJet printer is out of warrantee, do with it as you please. You paid for it. If you break it, you will have to pay HP to fix it :-). But if its on warrantee I hope you guys can all see why HP does not want to have to pay for warantee repairs due to operating printer in a way that it wasn't designed. The ink formula is a critical part of the entire service station behavior. Thats one of the reasons waterfast ink is so difficult.

Now you may wonder how HP is going to catch someone who refills cartridges. Generally its hard to prove that someone has refilled cartridges -- except in the case of those people who openly confess to it on notes :-). However our service people might ask if the customer has ever refilled ink cartridges. Some people use colored ink in their refills and of course I'm sure our service people could notice that. But don't worry, I won't turn you in :-).

Some of you may have seen this sorry, but it bounced the first time.

I have a SC1224 color monitor with original box, used for about a year,
in excellent condition. I am buying Calamus and rarely have a need for
color (I don't play computer games). I called MicrOtyme today to
check on new prices.
mail order list price Color: 339 Mono: 159 ($180 difference)

I would like to:

1) Trade for an Atari mono monitor (plus $130)

OR

2) Sell my color monitor for $240

Price US $
I prefer to trade but if i cannot find someone to trade then I'll sell it

(what I'ld really like is a NEC 2A multisync monitor but the $$:-(
maybe someone has a used NEC for sale ?? I'ld be very interested)

Prefer to sell/trade in US/Canada
(509)335-2441 (office) or home (509)334-9170

Thank you

Since you are so into bashing Atari and the ST line of computers, Mr. Rehrauer, perhaps you could enlighten us "Atari-owner loyalists" to why you consider the ST's to be "junk". I personally own an Atari ST, but have also done extensive (and I mean extensive) work on both Macintoshes and IBM-PC's during my four years at Cornell (A Mac and IBM dominated university). In my opinion (and I stress that), The Mac operating system is the most buggy thing I've ever encountered. If you want me to go into details about that, I will. As far as the IBM and compatibles, I believe they and the ST's are two very different types of computers that have their strong and weak points. I prefer a mouse and menu environment over a command line one. That is one reason I chose the ST. BTW, I think WINDOWS for the IBM stinks (talk about emulation!). Finally, If you think there is no good software for the ST line, you better wake up and smell the coffee! Pick up an issue of START magazine or any other good ST magazine, and you'll think differently.

1183. Can I separate the keyboard from the computer?

Newsgroup: comp.sys.atari.st
Date: 1989-09-29 11:53:54 UTC
From: loki@moncam.co.uk
Message-ID: <LOKI.89Sep29125354@marvin.moncam.co.uk>
Source record: 248755

Thanks to all those who helped me out with AES/VDI.

Next question: I've seen inside my 520 ST, and I've seen the 17 wire connection from the keyboard to the rest of the computer. Now I would like to make the keyboard separate, but I don't know if adding a whole length of cable (say two metres) will affect the operation. Has anyone else tried this, or can anyone say if the connection needs to be as short as it already is?

Thanks if anyone can help.

1184. Portfolio information

Newsgroup: comp.sys.atari.st
Date: 1989-09-29 12:50:17 UTC
From: portuesi@tweezers.esd.sgi.com
Message-ID: <PORTUESI.89Sep29135017@tweezers.esd.sgi.com>
Source record: 248756

I didn't get any responses to my request for information about the Atari Portfolio, but I did get the following info by calling Atari and reading a review of the Portfolio in _MicroTimes_, a computer newsmonthly in California. I hope it helps other people who are considering the Portfolio.

I quote the questions from my original post, followed by the information I was able to get:

> 1. Does the Portfolio have a serial port? What is the highest baud
> rate supported over the serial port?

Yes, serial ($79.95 option) and parallel ($49.95 option). Highest baud rate on serial port unknown.

> 2. What kind of memory technology does the 640K expansion use? How
> much will it cost to upgrade a Portfolio to 640K?

An upgrade memory expander is available (extra 256K+ and second card drive), $229.95. Two of these would be needed to expand to 640K.

> 3. Is there an optional external floppy drive?

no, but a PC memory card drive can be attached to standard PC.

> 4. What is the storage capacity of the external memory cards? How
> much does a memory card cost? What is the I/O speed of these cards?

Memory cards are battery-powered RAM devices. They come in 3 sizes -- 32, 64, and 128K

32K 79.99 storage cards plug into Portfolio card drive
64K 129.99 treat just like floppy.
128K 199.99

> 5. Does the Portfolio offer any sort of graphics capability? Can the
> display handle inverse video and the IBM graphics character set?

"very limited graphics capability", according to the Atari spokesperson.

> 6. Is the bundled software included in a built-in ROM, or does it
> come on memory cards?

applications prorgrams are built in.

> 7. What version of MS-DOS does the Portfolio use? Is MS-DOS built
> into ROM? Are external MS-DOS commands also built into ROM?

MS-DOS 2.11 is built into ROM.

> 8. The Portfolio supports a 40x8 virtual view onto an 80x24 screen.
> Is it possible to make applications which simply use the 40x8 physical
> screen only? I would prefer to see only a little bit of a document
> rather than a scrolling view of one-sixth of a standard display.

The bundled applications will work either in 80x25 virtual scroll mode
or in 40x8 physical mode. [I assume that it is possible to write or
modify existing MS-DOS applications such as MicroEmacs to function
within the 40x8 physical display].

> 9. Do MS-DOS programs that assume a monochrome display adapter and
> simply blast bytes into display memory work on the Portfolio?

"yes, on the whole", according to Atari. They do not guarantee that
all monochrome-adaptor based applications will work, however.

> 10. How long does the Portfolio run on three AA alkaline batteries?

6-8 weeks of normal usage (every day 1-2 hours). Portfolio provides a
battery low message when battery goes low.

> 11. does the portfolio keep contents of its memory when it is shut
> off?

Yes. same with RAM storage cards.

RAM cards are just like a floppy disk -- they may be removed from
portfolio and keep their contents indefinitely.

Atari wants a direct sale dealer network for the Portfolio --
currently the list of dealers carrying the Portfolito is rather small.
According to the representative I spoke to, Atari has few dealers for
the Portfolio now, and expects to expand their dealer list 1 or 2
percent at most in the future.

Now that the whole story is in, I can honestly evaluate whether or not
a Portfolio would suit my needs. I have a rather long commute back
and forth to work each day, which I could put to productive use with a
portable computer. Besides the built-in calendar/diary and address
book, I would need to be able to run MicroEmacs to edit programs and
correspondence (my fingers have Emacs ingrained in them too much to
learn the commands for the built-in editor), and be able to transfer
files to my workstation at work or my computer at home via a serial
port.

For my use, I would need the following:

Portfolio $399.95
Serial Port $79.95 to up/download stuff
128K RAM card $199.95 to hold Emacs + file transfer program
----
total for min.

usable system $680

I can buy a Toshiba T1000 for $600 (street price), which gives me more standard memory (512K), a larger display (80x25), a larger keyboard, and a standard 720K floppy drive. The only advantage the Portfolio has is its smaller size and weight, although the Toshiba is much smaller than many laptops, weighing only six pounds. Given Atari's method of distribution for the Portfolio, it seems unlikely that I could buy one at similar discount prices to make its "bang for the buck" ratio competitive with the Toshiba.

I'm not sure "Power without the Price" is the appropriate description for the Portfolio.

1185. More BibTeX information

Newsgroup: comp.sys.atari.st
Date: 1989-09-29 13:13:11 UTC
From: jlong@blackbird.afit.af.mil
Message-ID: <1363@blackbird.afit.af.mil>
Source record: 248757

Someone asked me a question concerning the distribution of BibTeX that just came across on comp.binaries.atari.st. In particular, he wanted to know about the 'support' files that were mentioned in the documentation. He suggested that I post a reply in case anyone else has any questions.

The only "support" files that one needs to run Bibtex (other than LaTeX and all of its required .sty files, .fmt file, etc...) would be the version of your desired bibliography .bst files. These are available on most systems, and will have a ??????.bst type name. This is the file you specify when you say something like: \bibliographystyle{ieee}

All of the other files mentioned by the documentation are produced by LaTeX when you first LaTeX your source file. If you LaTeX the file foo.tex, you will generate a file called foo.dvi and foo.aux. It is this foo.aux file that BibTeX must be able to find to work its magic. Of course, you must also have created your foo.bib file (the actual bibliograph database) before you run BibTeX! If this is unclear (it seems unclear to me and I just wrote it :-)), then read Lamport's LaTeX book and ask someone who has used BibTeX before.

If there is a strong enough desired expressed, I could probably gather some of the .bst files around here and post them to the net.

> the mechanism is still fast. It is so fast, that slow SCSI option has
> to be selected. For my system, that slows things down so much, across
> the board, that my hard drive I/O results in access slower than my
> creaking SH 204 hard drive!!!

You have the problem backwards. Some SCSI drives (mostly
Seagate SCSI drives) are too slow, not too fast. These drives do not
correctly respond to a new SCSI command if it is received "too soon"
after the completion of a previous command. (eg. issue a read command
for 10 sectors and as soon as that read completes issue another for 8
sectors, the second read command will fail on drives that have this
bug.)

There are two different "speed" issues involved. One is the
data transfer rate which is set by the drive interleave. The second is
the speed at which the drive can accept SCSI commands. A "fast" drive
that transfers data quickly may or may not have problems with accepting
SCSI commands quickly.

1188. Atari, TOS and GEM

Newsgroup: comp.sys.atari.st
Date: 1989-09-29 15:09:00 UTC
From: rehrauer@apollo.HP.COM
Message-ID: <45ede34f.71d0@apollo.HP.COM>
Source record: 248759

Recently in this group I called Atari's TOS and GEM software "junk".
I have been "gently reminded" by some readers that this is a less than
constructive criticism. True. I spoke hastily, while under the
influence of other frustrations not related to Atari. Sorry, Atari;
no doubt you get sick of hearing such blather. I should think and
then re-think before I post.

And while I believe we all know this, it probably should be said anyway:
"Anything I say or have said regards Atari or Atari products is to be
construed only as the personal opinions of an owner of Atari products,
not that of the corporate entity of the Apollo Division of Hewlett-Packard,
nor of H.P. itself. I speak for myself."

There, can I come out of the corner now, Mom? Good.

So, Atari, are we ever going to see any substantive improvements to GEM?
Do you own the rights to the Atari incarnation to GEM, such that you can
even do so? Can we at least have resolution-independency, such that we
needn't reboot our machines to switch from medium- to low-resolution screens
in an application? Why does David Beckmeyer say that you have never shown
any interest in incorporating his multi-tasking kernel into the ST? You
incorporated Dave Small's "Twister" disk format concept into the Megas, I
understand -- why not multi-tasking for the TT if not older models? You
are aware of it, are you not? Are there technical difficulties? Legal
difficulties? Ego difficulties? If the TT is as fast as the '030 is
potentially capable of making it, will Atari release something like PC-Ditto
on it, to provide (free of charge) MS-DOS emulation at (I'm guessing)
XT-clone speeds? Boy, would *THAT* be a marketing hook! How about
incorporating other, less drastic improvements -- such as the executable-
compression scheme used in products like PACKER and DC SQUISH? Or the
palette-switching scheme used by Spectrum512 to get the full hardware
palette of 512 colors on a single screen -- could ANTIC Software (or
whomever owns the technique) be persuaded to liscense it to developers?
Do they already? It's a mighty impressive-looking gadget, even if it
does eat the majority of the cpu's processing power. How about collecting
some of the best public domain widgets, cleaning them up (to give them
coherent user-interfaces, if they have such) and distributing them on
an extra disk or two to new owners? At least a RAM disk would be nice
-- is that a feature of the TOS 1.4 release, by the way? Wouldn't it
be fairly easy to add a new device for a RAM disk to TOS, so that, for
example, formatting the "Z:" drive or some such would create a RAM disk?
Can we ever expect to see the 6-desk-accessory limit lengthened, since so
many accessories are usually employed to get around weaknesses in TOS and
GEM? Are TOS and GEM in "maintenance, we-won't-touch-it-until-it-bites
mode"? Is Atari planning to do anything with its CD-ROM player, now that

it (apparently) is a real product? That is to ask, will Atari release anything on CD-ROM, or is it a box waiting for applications? Shouldn't Atari do something in the way of promoting recommended standard methods to do things like printer-drivers, visual appearance of GEM dialogues, etc? Wasn't there a similar recommendation for command-line parsing & environment variables & the like from Atari a couple of years ago? Is Atari serious about getting its laser printer supported by 3rd party software? Is Atari serious about selling its own laser printers, when the street-price of lasers that support de-facto standard protocols (e.g.: the new H.P. LaserJet IIP, or any of a number of cheapo LaserJet clones) is down around $1,000? Will Atari ever offer any sort of upgrade allowance to entice ST owners to "buy up" to an STE or TT, similar to what Commodore did for A1000 owners when the A2000 was announced? Are the STE and TT European machines, or will we ever see them here in the U.S.? When can we expect to actually be able to walk into an Atari-authorized dealer (assuming any still exist in the immediate area) and see one, let alone consider buying one? Will Atari advertise either machine in this country, in magazines, say? Back in 1986, START magazine published an interview with the prez of Atari, in which Mr. Tramiel said that the "new, 68020-based Ataris" would be released "within months of this interview" or some words to that effect. Rumors of the "TT" floated for months and months, and apparently prototypes were shopped around. Why should we believe that this (words from Atari employees to the effect that they have TTs on their desks notwithstanding) is anything different; i.e.: yet another VaporBox?

From what I have seen on comp.sys.(apollo|sun|amiga|mac), such questions would get a reasoned response from someone within the organization. The Commodore folks seem especially good about this, unless the questions are incredibly offensive. (Are mine?) I don't own an Amiga, so that isn't an under-handed plug for that box, just an observation. Have I just missed such answers that were given earlier? Enquiring minds wanna know.

Does anyone know if RONSAT is planning to make a version of STonehenge
that uses the 1 meg ram chips?? It would be nice to have a 4 or even 8 meg
version!! That would make one nice RAMDISK!! Especially if it is battery backed
up, so that you don't lose memory between bootups!! Heck, with an 8 meg Ramdisk,
I could put my entire Mark Williams C compiler and really fly!!!

> Any help would be greatly appreciated.

I ask ed the same thing here a few months ago and got no response.
I read an article in a Brit ST magazine comparing sound digitizers and
only one of them had hooks for C programs.

Unfortunately, I don't have the article here at work, and I don't
remember which digitizer it was. I am not even sure that the specific
sounds digitizer was one sold in the US.

I am interested in that, so if you get any feedback please post it here.

Thanks.

You don't need multitasking, you need revolver.
revolver will let you have all of those programs in memory at the same time
and allow you to switch between them. files can be transfered among
the different programs through a common ramdisk.
also, you can "roll-out" a partition to disk. you could have
1st word in a partition with a document started and roll it out to disk,
turn off the st, go away and come back later and roll it back in.
everything will be like it was when you left. (cursor position and all!)

To be fair, the other Atari store in the south bay is called San Jose Computer.
They let you tryu out software before you buy it. I guess I got used to that
and expected it everywhere, but it wasn't to be had in Sacramento. SJC
is worth the drive. I used to drive there from Stanford to get Atari software
and good service!

DISCLAIMER: I have no relationship with SJC except as a satisfied customer.

...
> "How do you expect to sell this stuff if I can't look at it? Do you
> know anything about these?"

A software dealer I know of (PC/Mac stuff only) was always more than happy to open up a package and demo it for you. He had a shrink wrap machine in the back of the store. If you didn't buy the software, it was rewrapped and back on the shelves "like new" moments after you were out the door.....
It also gave him the opportunity to play with and learn a bit about the software without having to sacrifice a piece of merchandise.

OK, so maybe it's kind of like having the waiter spit in your food.
But nobody knew the difference, and it seemed to make everybody happy.

Not that I ever bought anything there..........

1199. SLM804 from emulators... Where the problem might lie.

Newsgroup: comp.sys.atari.st
Date: 1989-09-29 20:05:02 UTC
From: dag@per2.UUCP
Message-ID: <880@per2.UUCP>
Source record: 248770

Some people have gotten really angry over the lack of SLM804 support in the various emulators running on the ST. Although I can simpathize with these people, I must take exception to the accusations that they are making about the developers of these emulators.

The SLM804 is not a simple laser printer with its own imaging engine and some sort of byte serial interface to the computer. Support of the printer requires the use of an in memory bitmap large enough to contain every pixel imaged on the page (actually, with double buffering and async programming, the in memory bitmap can be smaller, but it is very difficult to program the ST in that manner.) This bitmap is then shipped to the printer via the DMA port.

300dpi on an 8.5" x 11" page with an active area of 8" x 10.5" requires 2400 x 3150 pixels, or 300 bytes x 3150 scans, or 945,000 bytes. In addition, this in-memory bitmap must be written to with text and graphics properly scaled to the output device. Postscript output requires a postscript interpreter, HP LaserJet output requires an HP PDL interpreter/emulator, etc. These interpreters and emulators take a lot of time and effort to write, are hard to debug, and require considerable memory for internal font and format storage beyond the page bitmap.

The emulators do not run under or along with TOS. These programs must either run as part of the emulator itself or under the emulator.
Add to that that the Atari DMA channel is very tricky to get right, and the problem gets a little worse. Add to that that this support must be transparent to the application running under the emulator, so it must behave as a common device in whatever environment is being emulated.

David Small and the people at AG would probably be willing to integrate improved SLM804 support if someone were to offer them the required code at a reasonable price in a useable form. The support would probably be limited to those machines with at least 2, and probably 4, megabytes.

Make whatever criterion you wish for your software selection. Tell the world about those choices that you make. State a desire for features in products that you find unusable because of the lack of those features.

Please don't keep whining about those "missing" features which were never promised by the developers in the first place. Would it be better if the product were delayed by the additional months/years that it might take for a single programmer or a small team to add those features which could only be used by a small minority of what already is a small market?

Maybe someone could develop a program that runs under MAC-OS specific to the ST which would do a 300dpi imagewriter (or DeskWriter) emulation

on an SLM804 and sell this as a separate item.

If we, as a user community, could have a little more understanding of
the technology that we demand and those who attempt to provide us with
it, morale (which is VERY important in this business) would be much
better.

1200. Ethernet, Atari?, and X Windows

Newsgroup: comp.sys.atari.st
Date: 1989-09-29 20:19:24 UTC
From: tyler@stpl.UUCP
Message-ID: <199@stpl.UUCP>
Source record: 248771

We have developed an Ethernet device for the Mega ST and
ST (1040) line. The Mega plugs into the unit and the 1040 version
runs off the DMA port. In addition, it has 8 serial ports
and two parallel ports. However...

We have only had the time to implement the KA9Q TCP/IP package
with this system and only in the mega version. It runs quite nicely with
TCP/IP server functions such as telnet, ftp etc.

What we would really like is to implement an X windows server for the
ST line. In this regard, we understand that it has been done. We also
understand that someone has implemented NFS for this system. Does anyone
know who/where we can obtain the information from.

Hi, kids.....

Hey, I'm looking for some info regarding upgrading a 520ST to a megabyte. How much does it cost....Is it a kit, or do I have to pay some clown $150 to plug in a couple chips, etc...

Any clues?

Alos, I'm looking at getting either a cheap hard disk, or a double sided floppy drive.

I'm trying to get this system MIDI-able. (Refer to previous postings for that adventure. Type "/Bitching" for a good chuckle.)

Any and all info would be greatly appreciated.

1204. Re: Bitching about S/W distribution / MIDI HELP??!?

Newsgroup: comp.sys.atari.st
Date: 1989-09-29 22:09:54 UTC
From: stank@anvil.WV.TEK.COM
Message-ID: <4773@orca.WV.TEK.COM>
Source record: 248775

Many software stores make a great deal of money selling game software. I suspect that Mitch Shapiro wondered into such a store. That kind of store is ill equipped to handle the sales of MIDI software. Selling MIDI software requires the salesperson to have working knowledge of both computers and music, the type of people Mitch encountered have neither. Fortunately, there are some alternatives. Try shopping for MIDI software in a musical instrument store. The better stores usually have serveral different types of computer available. Most musicians want to try out instruments before they lay down their hard earned bucks and this tradition has also carried over to MIDI software. Here are a few pointers to keep in mind when dealing with music stores:

o Sales people in music stores are typically paid a comission. If you want good help, find the salesperson that is most helpful and deal only with them. Don't jerk them around. If you don't intend to buy, don't waste their time, it only hurts your reputation as a good customer. If you buy consistantly from one salesperson he or she will see you as a source of revenue and thus work harder to earn a sale.

o Expect to haggle on the price. They will charge you list price unless you haggle. Typically discounts of 20 to 30 percent can be had. I've found that when I work with only one salesperson the negotiations become shorter and sometimes they will even volenteer a reasonable discount without my saying a word.

o If you are looking at a purchase and it requires a lot of in-store trial, try to identify a time when the store isn't very busy and then set up an appointment to try the software then. You'll never get good service if the saleperson is trying to help 15 people at once. Also, ask about product demo's, sometimes they are put on by the product manufacturer and they can answer many questions.

Those are my thoughts on buying MIDI software. Unfortunately, I don't know the area where Mitch lives and thus cannot recommend any music stores there. Mitch - I think a brief posting to rec.music.synth might yeild a few store recommendations in your area.
